INDEX

5	23/05/2023	Install hyperledger fabric and composer. Deploy and execute the application.	105	
6	22/06/2023	Write a program to demonstrate mining of Ether.	113	
7	22/06/2023	Demonstrate the running of the blockchain node.	115	
8	22/06/2023	Demonstrate the use of Bitcoin Core API.	117	
9	23/06/2023	Create your own blockchain and demonstrate its use.	120	

PRACTICAL 1

AIM: Write the following programs for Blockchain in Python:

[A] A simple client class that generates the private and public keys by using the builtin Python RSA algorithm and test it.

CODE:

```
import binascii
from Crypto.PublicKey import RSA
from Crypto.Signature import PKCS1_v1_5
from Crypto import Random

class Client:
    def __init__(self):
        random = Random.new().read
        self._private_key = RSA.generate(1024, random)
        self._public_key = self._private_key.publickey()
        self._signer = PKCS1_v1_5.new(self._private_key)

    @property
    def identity(self):
        return
binascii.hexlify(self._public_key.exportKey(format="DER")).decode("a
scii")

# Create an instance of the Client class
UDIT = Client()

# Print the public key (identity) of the client
print("\nPublic Key:", UDIT.identity)
```

OUTPUT:

```
Public Key:
 30819f300d06092a864886f70d010101050003818d0030818902818100c9b694d2aa1855dbbad947
 5aac327ab784b7ae7a14b81fbe416e5886f492dff2fb71a80cdb194d212a11523f42271c4a962410
 ce6bd9dcf28cbd43aa9fe8a6da2a54345ebbcf3facd1213fcc800a34ded20309db83389299c8bb83
 2532b28a281fef07971421d56740a95ddfd789cdaafad97aea839584e3d92aee5664ec42d7020301
 0001
```

[B] A transaction class to send and receive money and test it.

CODE:

```
import binascii
import collections
import datetime
from Crypto.Hash import SHA
from Crypto.PublicKey import RSA
from Crypto.Signature import PKCS1_v1_5
from Crypto import Random

class Client:
    def __init__(self):
        random = Random.new().read
        self._private_key = RSA.generate(1024, random)
        self._public_key = self._private_key.publickey()
        self._signer = PKCS1_v1_5.new(self._private_key)

    @property
    def identity(self):
        return
binascii.hexlify(self._public_key.exportKey(format="DER")).decode("a
scii")

class Transaction:
    def __init__(self, sender, recipient, value):
        self.sender = sender
        self.recipient = recipient
        self.value = value
        self.time = datetime.datetime.now()

    def to_dict(self):
```

```
        identity = "Genesis" if self.sender == "Genesis" else
self.sender.identity
        return collections.OrderedDict(
            {
                "sender": identity,
                "recipient": self.recipient,
                "value": self.value,
                "time": self.time,
            }
        )

    def sign_transaction(self):
        private_key = self.sender._private_key
        signer = PKCS1_v1_5.new(private_key)
        h = SHA.new(str(self.to_dict()).encode("utf8"))
        return binascii.hexlify(signer.sign(h)).decode("ascii")

UDIT = Client()
UGC = Client()

t = Transaction(UDIT, UGC.identity, 5.0)

print("\nTransaction     Recipient:\n",     t.recipient)          #
print("\nTransaction   Sender:\n",   t.sender)   print("\nTransaction
Value:\n", t.value)
signature = t.sign_transaction()
print("\nSignature:\n", signature)
```

OUTPUT:

```
Transaction Recipient:
 30819f300d06092a864886f70d010101050003818d0030818902818100be0978593e24a777060c9b

PRACTICAL 2

AIM: Install and configure Go Ethereum and the Mist browser. Develop and test a sample application.

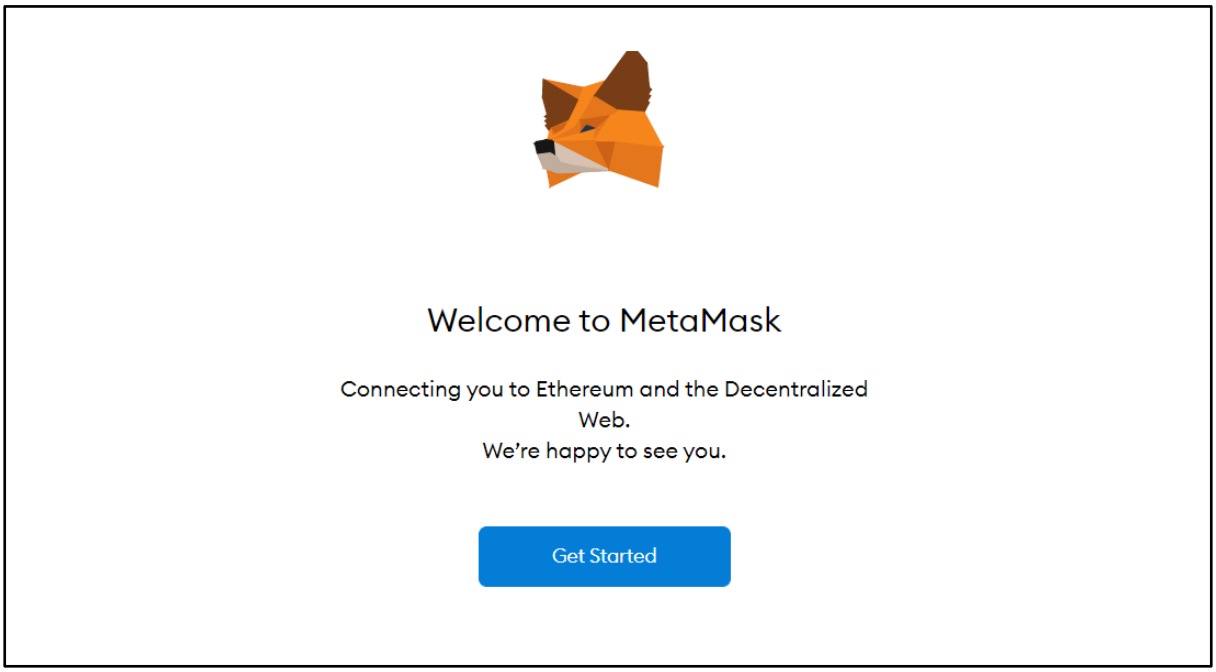
Step 1: Go to Chrome Web Store Extensions Section.

Step 2: Search MetaMask.

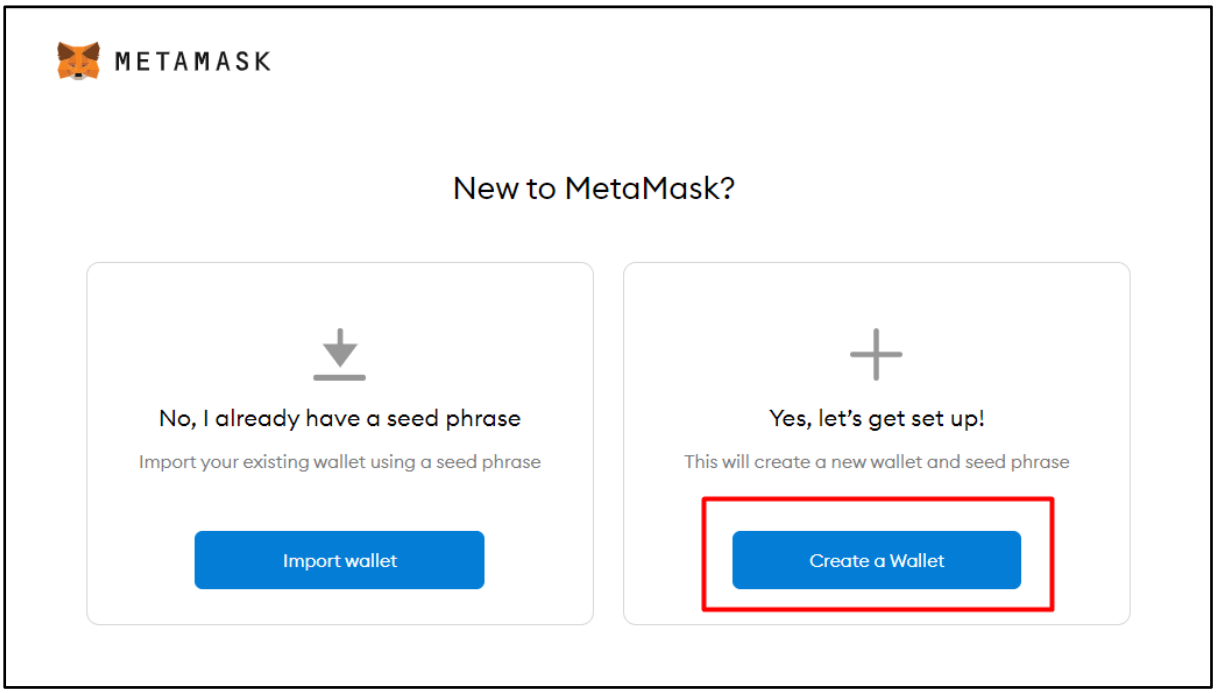
Step 3: Check the number of downloads to make sure that the legitimate MetaMask is being installed, as hackers might try to make clones of it.

Step 4: Click the Add to Chrome button.

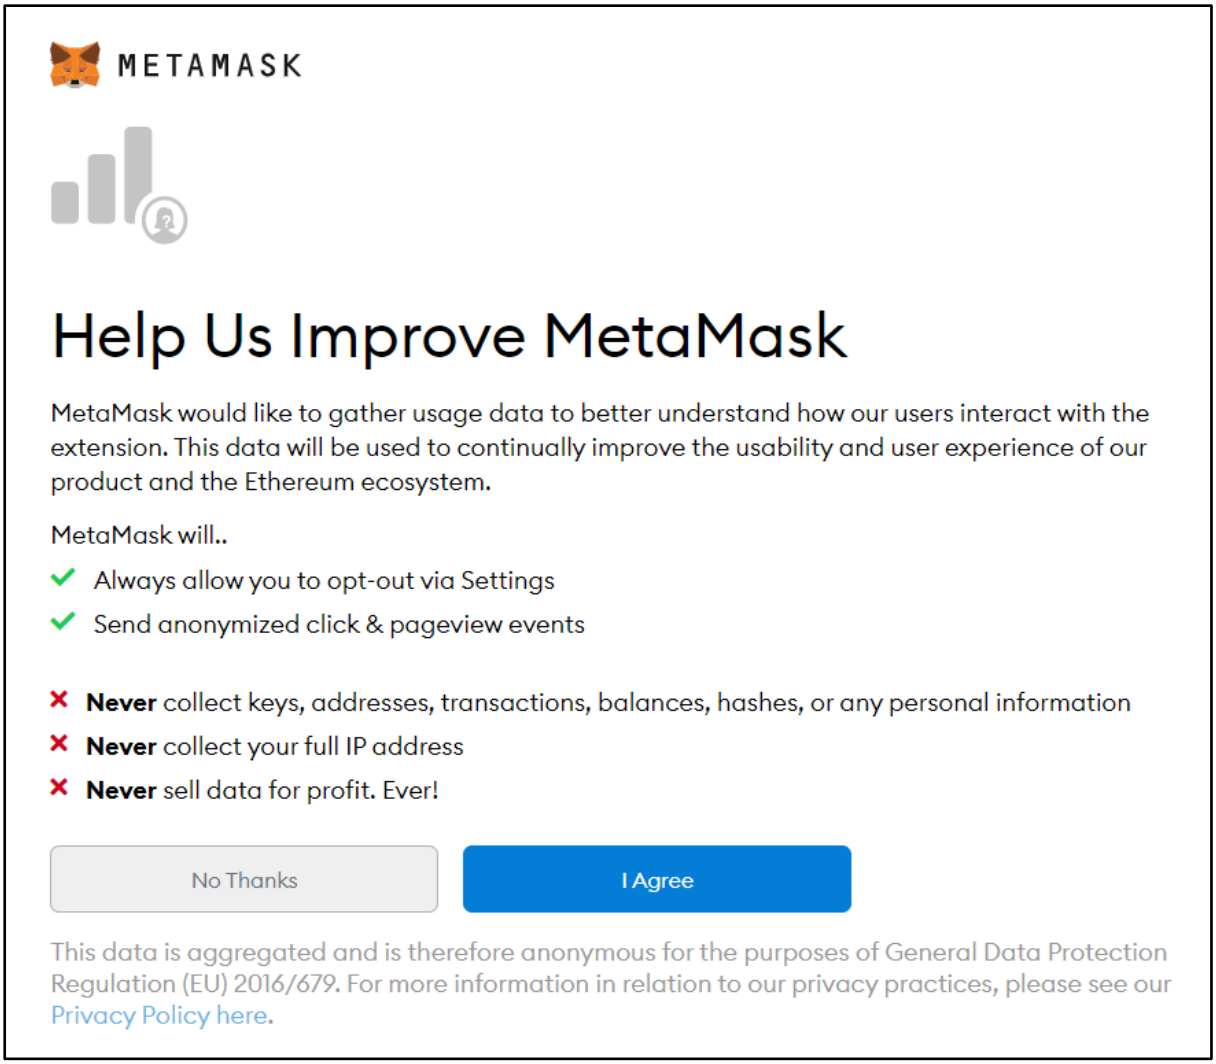
Step 5: Once installation is complete this page will be displayed. Click on the Get Started button.



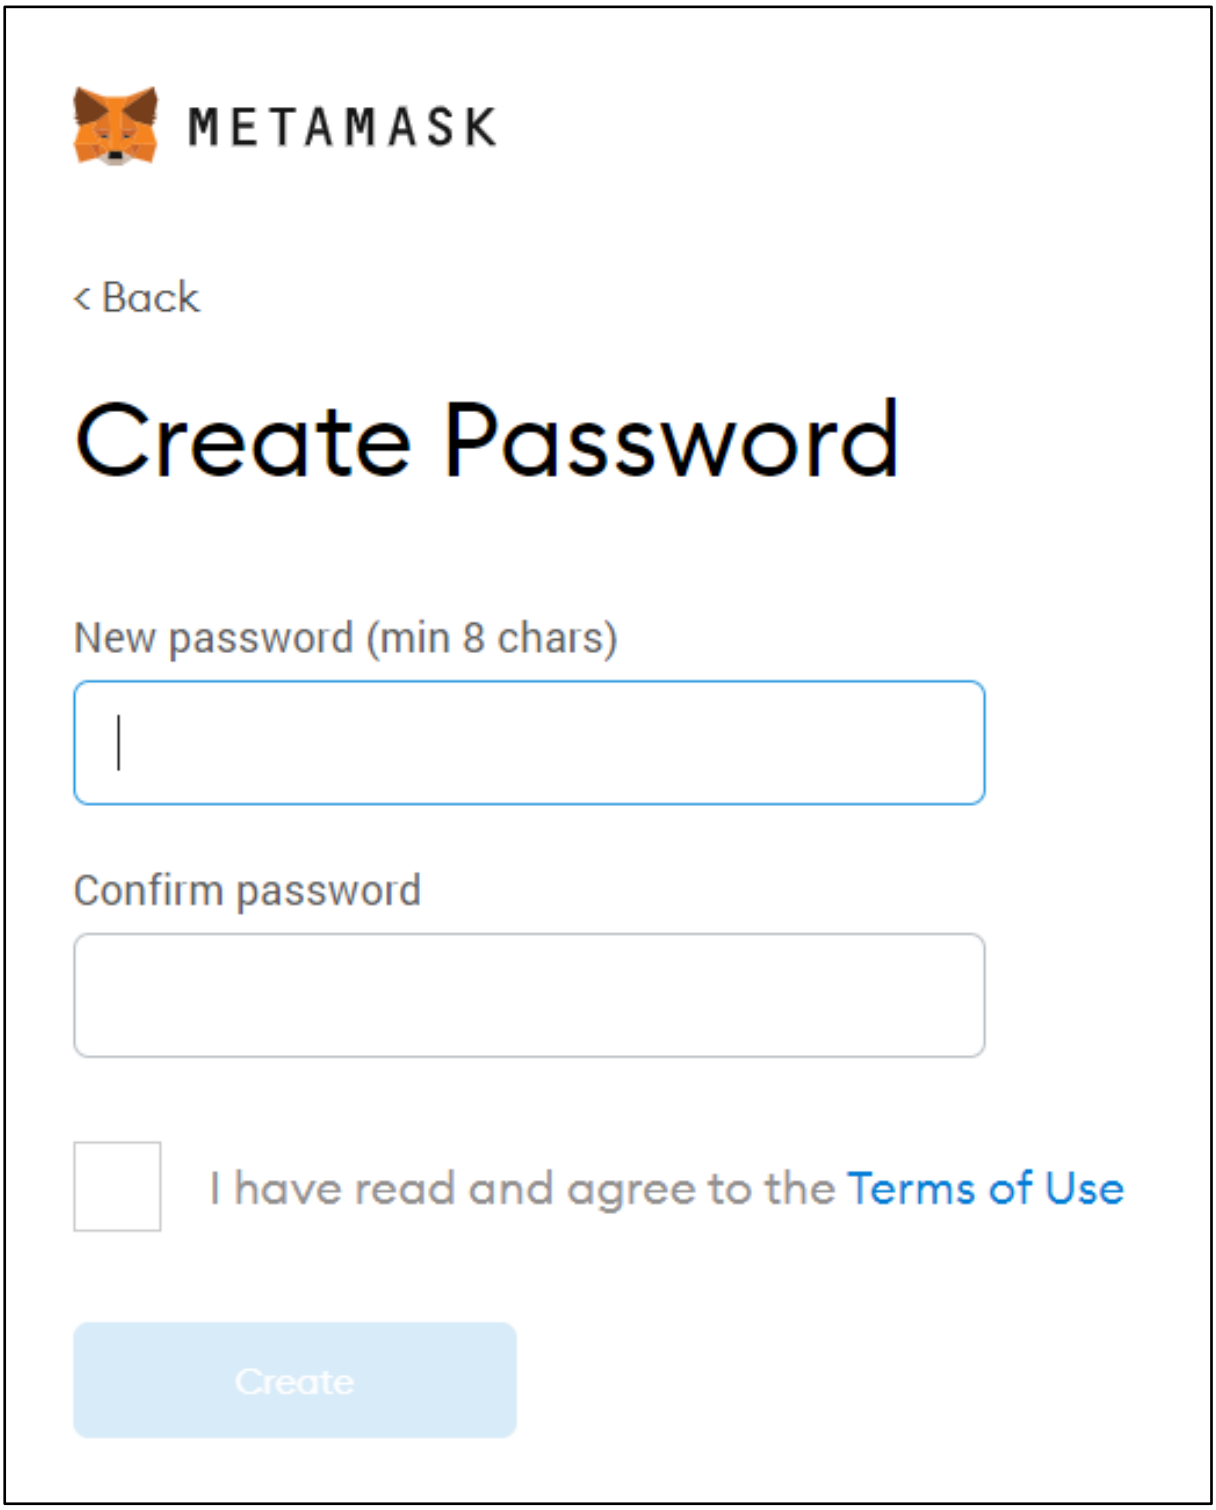
Step 6: This is the first time creating a wallet, so click the Create a Wallet button. If there is already a wallet then import the already created using the Import Wallet button.



Step 7: Click I Agree button to allow data to be collected to help improve MetaMask or else click the No Thanks button. The wallet can still be created even if the user will click on the No Thanks button.

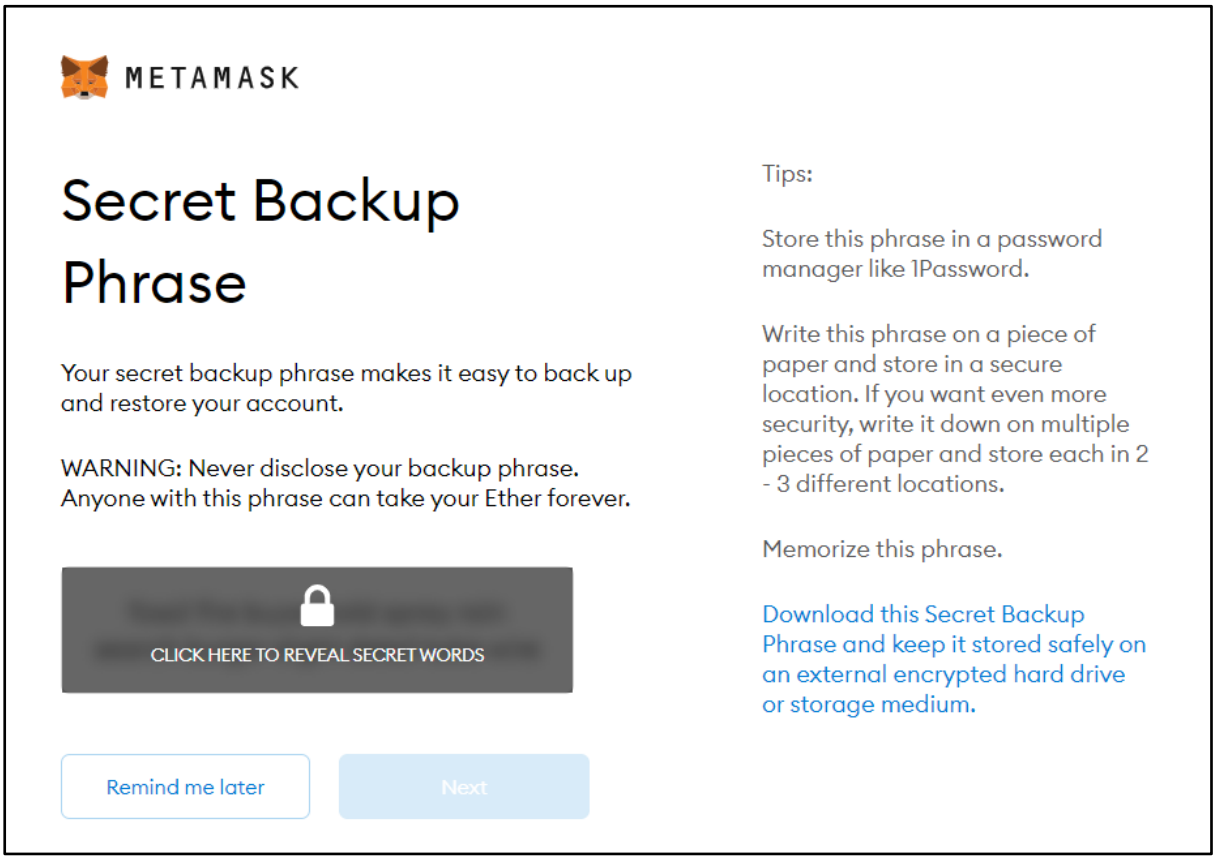


Step 8: Create a password for your wallet. This password is to be entered every time the browser is launched and wants to use MetaMask. A new password needs to be created if chrome is uninstalled or if there is a switching of browsers. In that case, go through the Import Wallet button. This is because MetaMask stores the keys in the browser. Agree to Terms of Use.

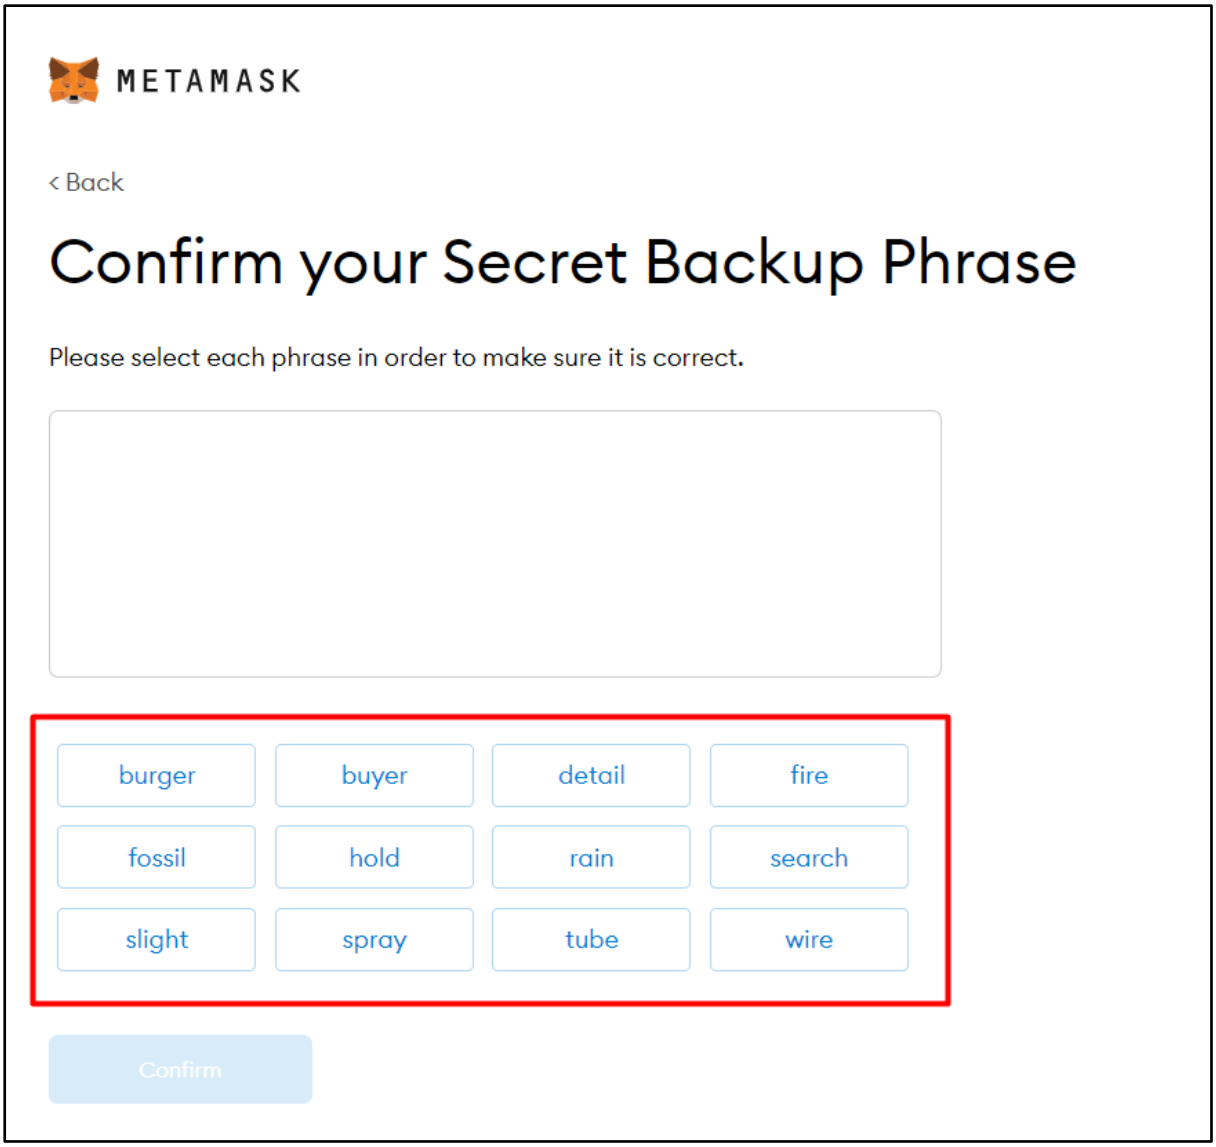


Step 9: Click on the dark area which says Click here to reveal secret words to get your secret phrase.

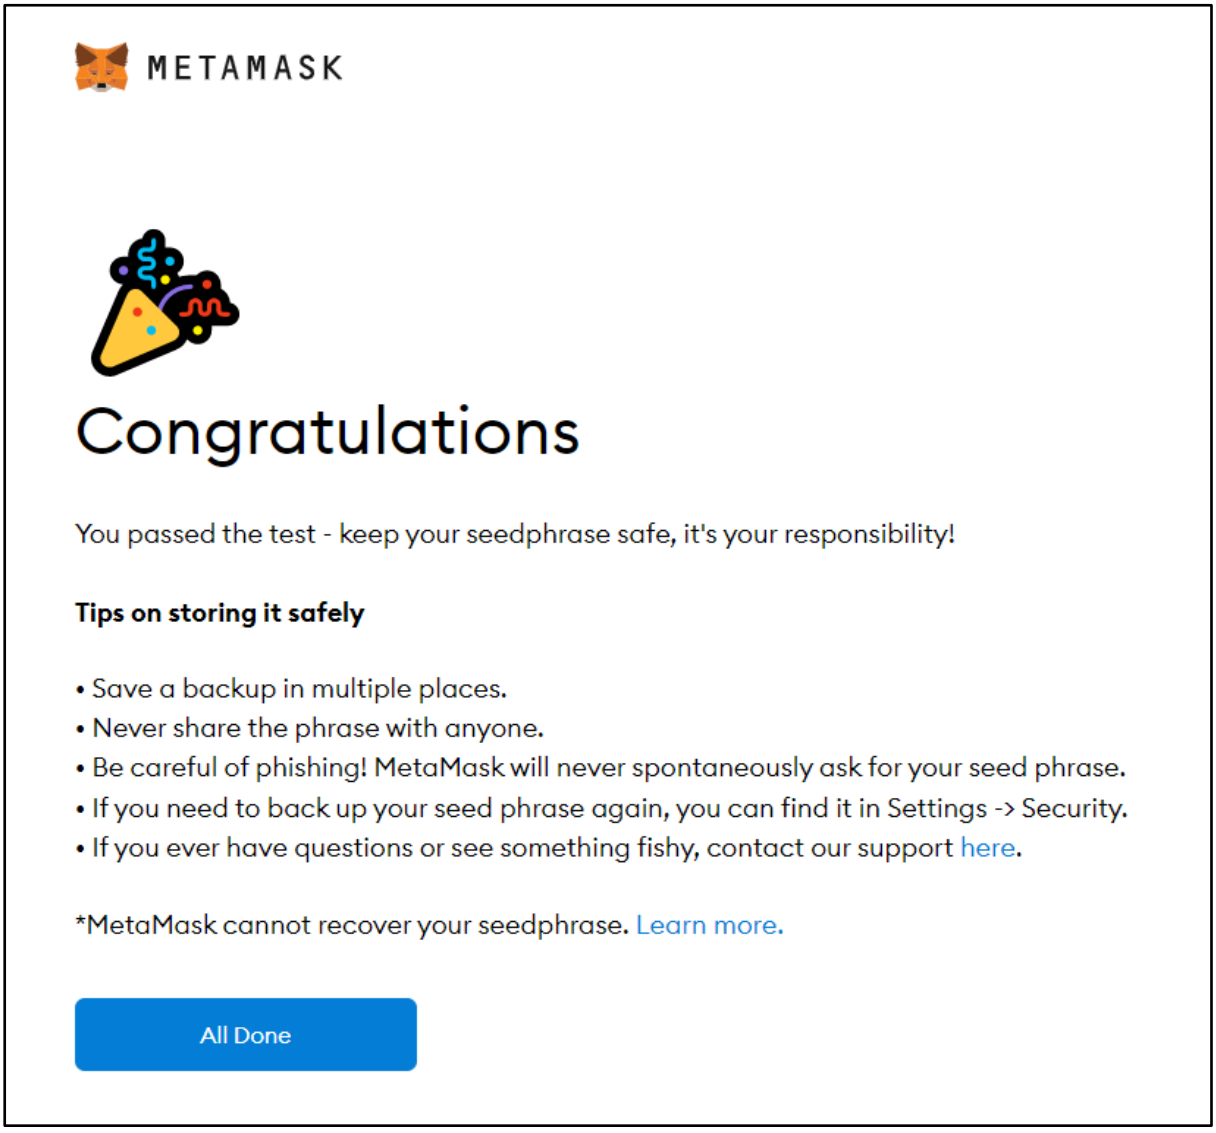
Step 10: This is the most important step. Back up your secret phrase properly. Do not store your secret phrase on your computer. Please read everything on this screen until you understand it completely before proceeding. The secret phrase is the only way to access your wallet if you forget your password. Once done click the Next button.



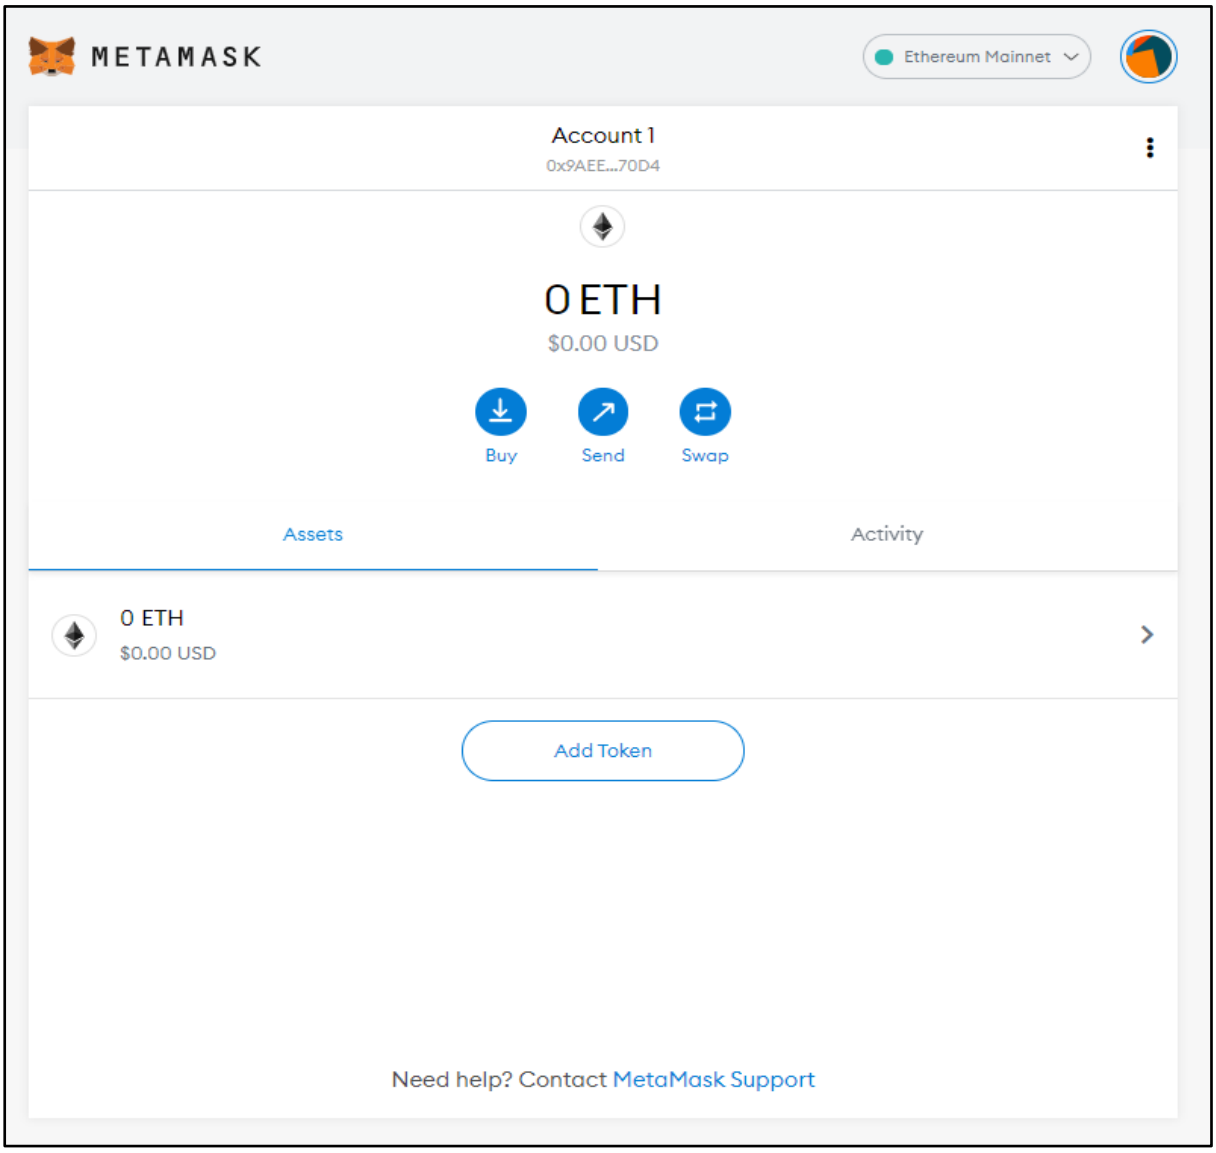
Step 11: Click the buttons respective to the order of the words in your seed phrase. In other words, type the seed phrase using the button on the screen. If done correctly the Confirm button should turn blue.



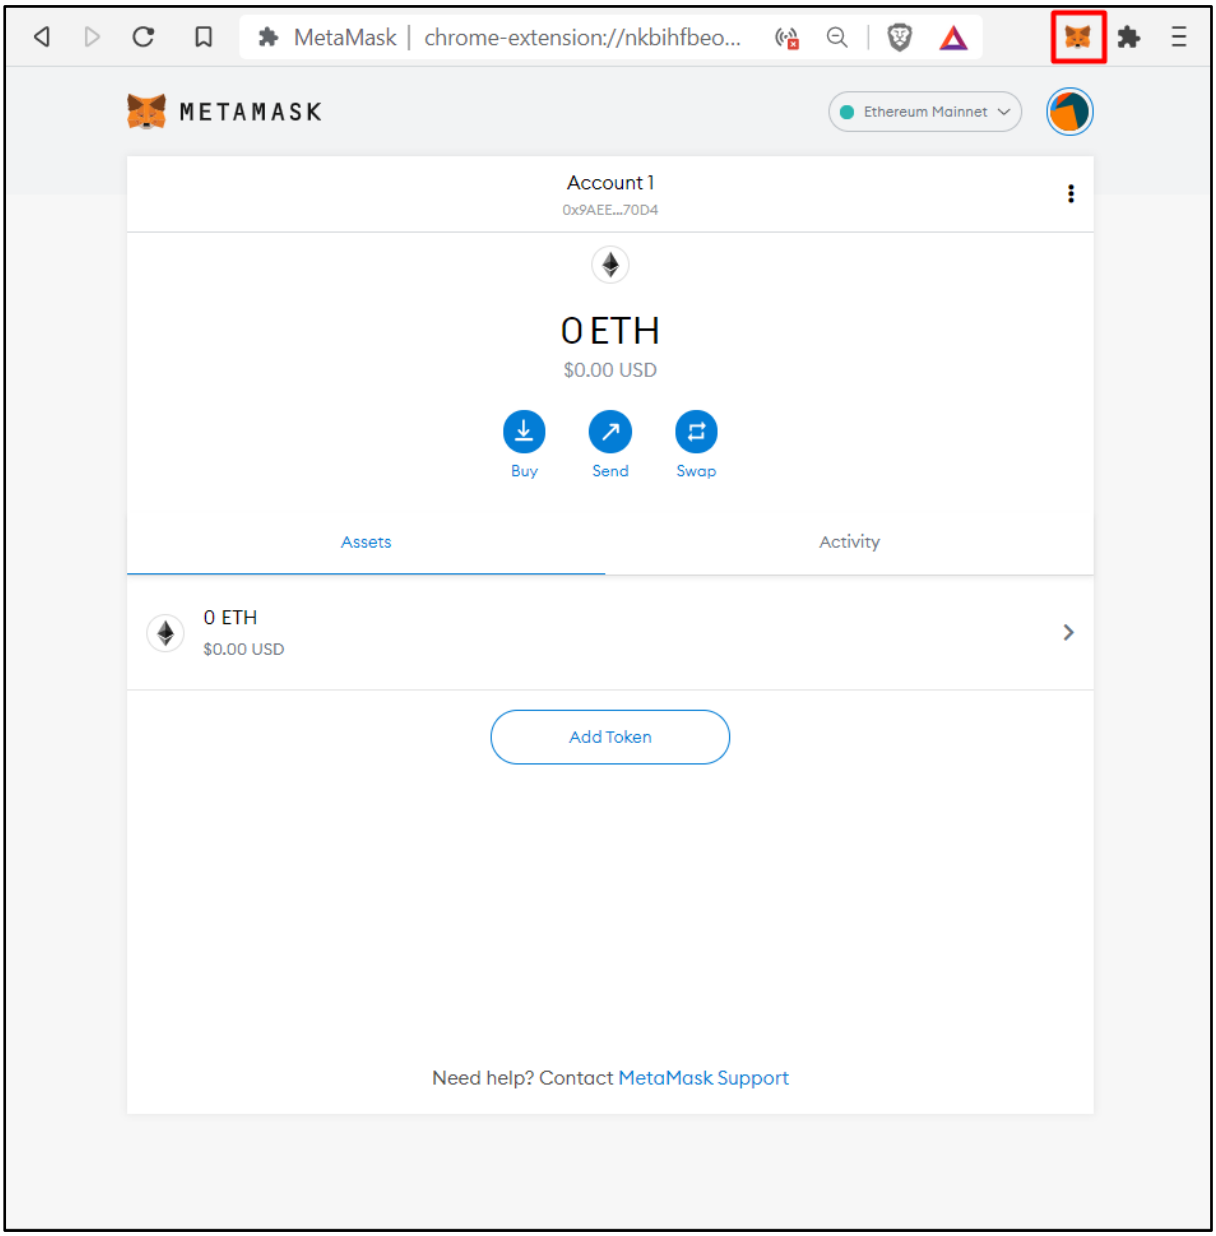
Step 12: Click the Confirm button. Please follow the tips mentioned.



Step 13: One can see the balance and copy the address of the account by clicking on the Account 1 area.



Step 14: One can access MetaMask in the browser by clicking the Foxface icon on the top right. If the Foxface icon is not visible, then click on the puzzle piece icon right next to it.



PRACTICAL 3

AIM: Implement and demonstrate the use of the following in Solidity:

[A] Variable, Operators, Loops, Decision Making, Strings, Arrays, Enums, Structs, Mappings, Conversions, Ether Units, Special Variables.

[I] Variable

[i] State Variable

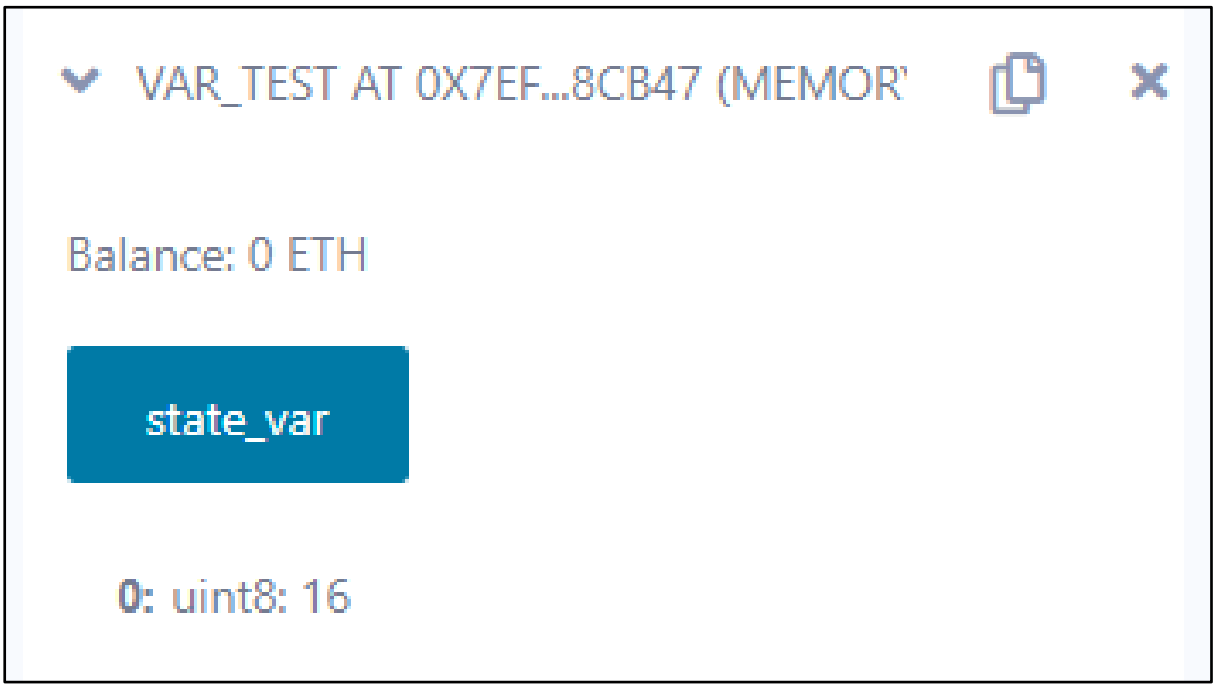
CODE:

```
//Solidity program to demonstrate state variables
pragma solidity ^0.5.0;

// Creating a contract
contract var_Test
{
    // Declaring a state variable
    uint8 public state_var;

    // Defining a constructor
    constructor() public {
        state_var = 16;
    }
}
```

OUTPUT:



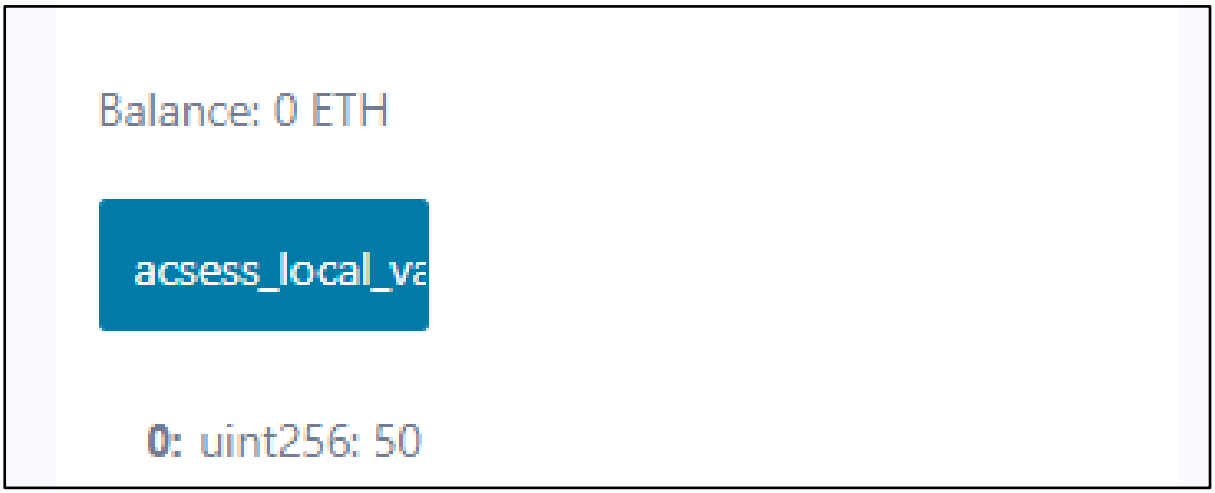
VAR_TEST AT 0X7EF...8CB47 (MEMOR'
Balance: 0 ETH
state_var
0: uint8: 16

[ii] Local Variable

CODE:

```
//Solidity program to demonstrate Local variables
pragma solidity ^0.5.0;
// Creating a contract
contract local_var_Test
{
    // Defining function to show the declaration and
    // scope of Local variables
    function acsess_local_variable() public pure returns(uint) {
        // Initializing Local variables
        uint a = 10;
        uint b = 40;
        uint sum = a + b;
        // Access the Local variable
        return sum;
    }
}
```

OUTPUT:

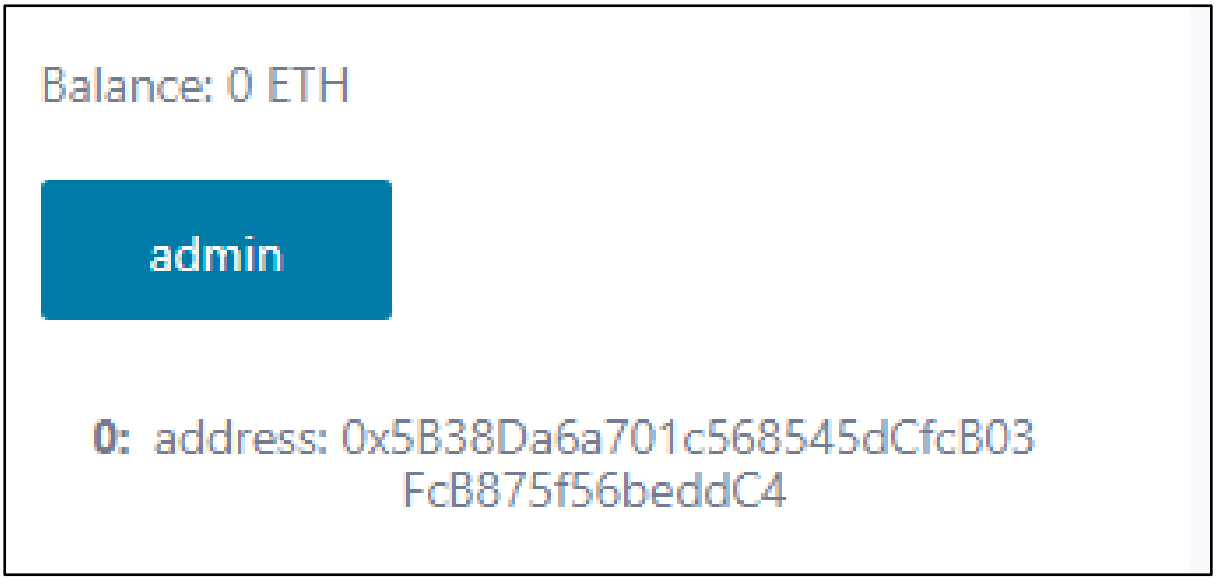


[iii] Global Variable

CODE:

```
//Solidity program to show Global variables
pragma solidity ^0.5.0;
// Creating a contract
contract globalTest
{
    // Defining a variable
    address public admin;
    // Creating a constructor to
    // use Global variable
    constructor() public
    {
        admin = msg.sender;
    }
}
```

OUTPUT:



[II] Operators

CODE:

```
pragma solidity ^0.4.0;

contract Operators {

    uint256 result = 0;

    function addition(uint256 a, uint256 b) public pure returns (uint256) {
        return a + b;
    }

    function subtraction(uint256 a, uint256 b) public pure returns (uint256)
{
        return a - b;
    }

    function division(uint256 a, uint256 b) public pure returns (uint256) {
        return a / b;
    }

    function multiply(uint256 a, uint256 b) public pure returns (uint256) {
        return a * b;
    }
}
```

OUTPUT:

PRACTICAL 4

AIM: Implement and demonstrate the use of the following in Solidity:

[A] Withdrawal Pattern, Restricted Access.

[I] Withdrawal Pattern

CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.0;

contract WithdrawalPattern {
  address public owner;
  uint256 public lockedbalance;
  uint256 public withdrawablebalance;

  constructor() {
    owner = msg.sender;
  }

  modifier onlyowner() {
    require(msg.sender == owner, "Only the owner can call this function");
    _;
  }

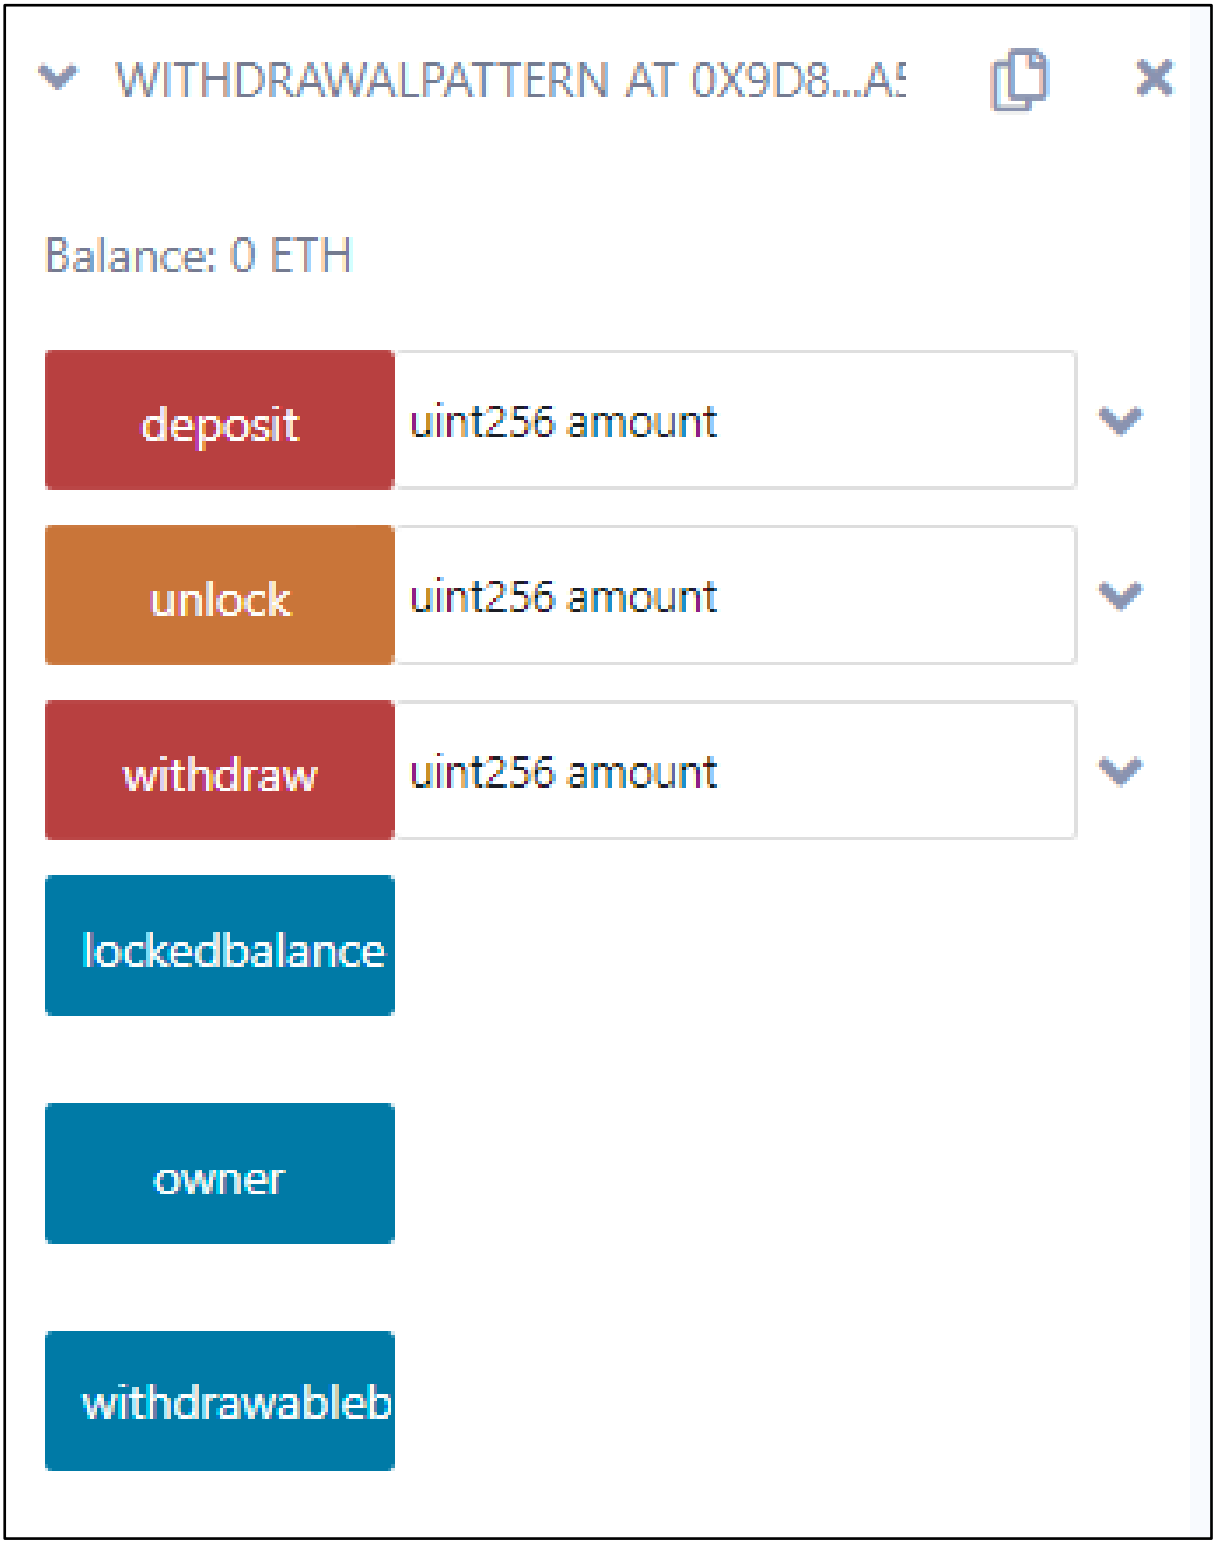
  function deposit(uint256 amount) public payable {
    require(amount > 0, "Amount must be greater than zero");
    lockedbalance += amount;
  }

  function withdraw(uint256 amount) public payable onlyowner {
```

```
    require(
      amount <= withdrawablebalance,
      "Insufficient withdrawable balance"
    );
    withdrawablebalance -= amount;
    payable(msg.sender).transfer(amount);
  }

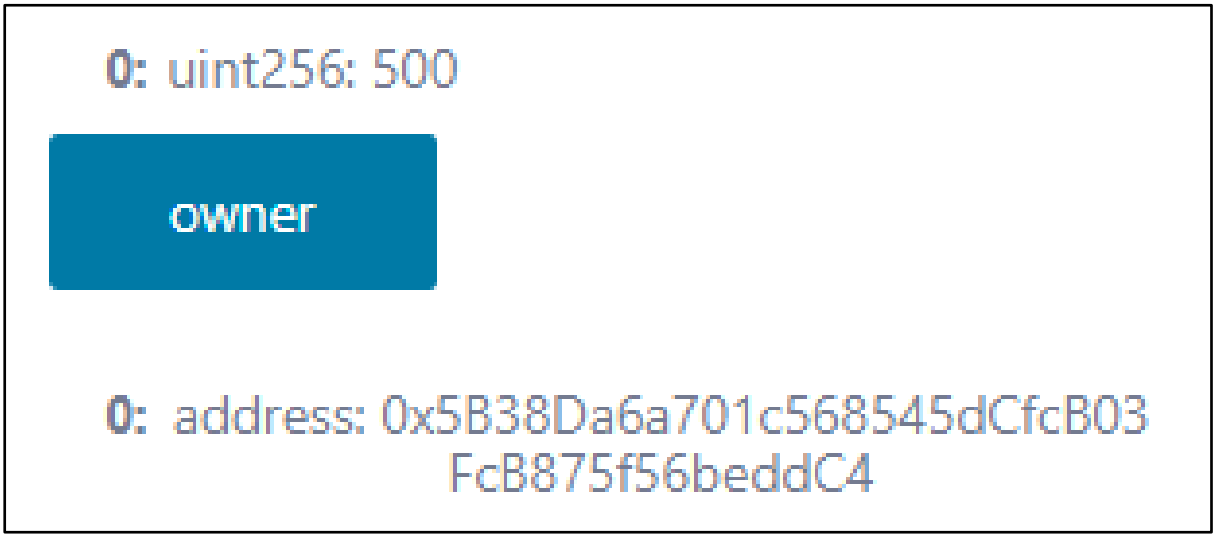
  function unlock(uint256 amount) public onlyowner {
    require(amount <= lockedbalance, "Insufficient locked balance");
    lockedbalance -= amount;
    withdrawablebalance += amount;
  }
}
```

OUTPUT:



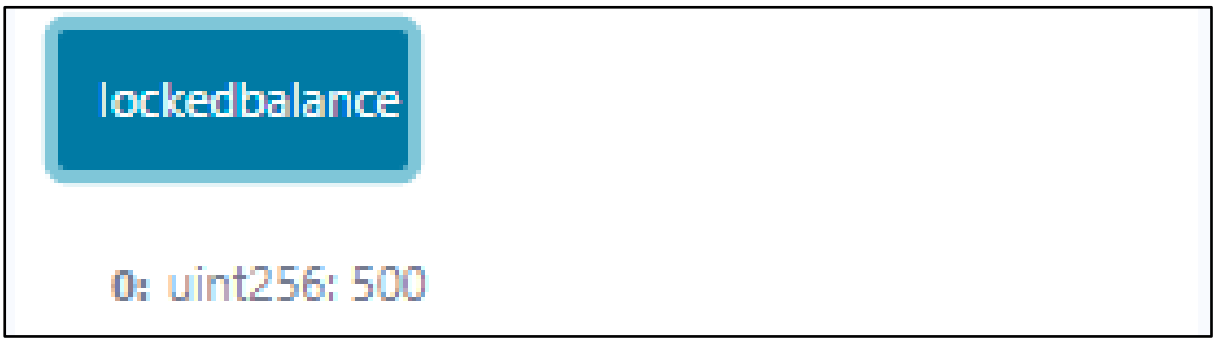
WITHDRAWALPATTERN AT 0X9D8...A
Balance: 0 ETH
deposit
uint256 amount
unlock
uint256 amount
withdraw
uint256 amount
lockedbalance
owner
withdrawableb

Step 1: Click on owner to create the owner object.

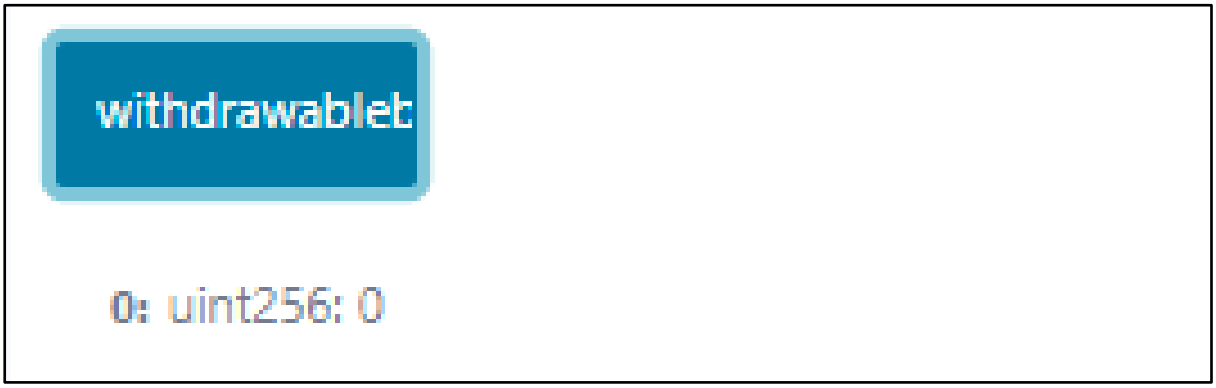


Step 2: Enter an amount and click on deposit.

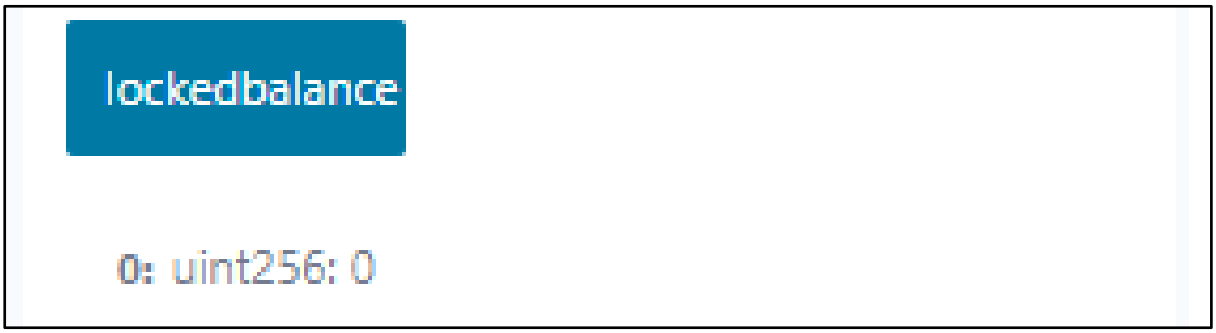
Step 3: Click on locked balance button to display the locked amount in the account.



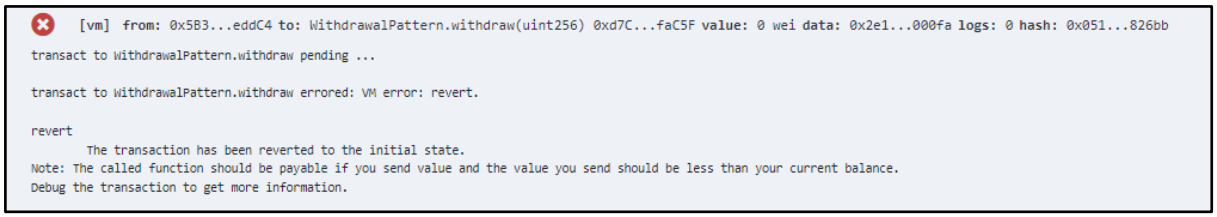
Step 4: Click on withdrawable balance button.



Step 5: Click on unlock button and enter any amount to transfer amount to withdrawable balance. Check locked balance and withdrawable balance.



Step 6: Enter any amount you want to withdraw and click the withdraw button. You should get an error and the transaction should be reverted.



[II] Restricted Access

CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

contract AccessRestriction {

    address public owner = msg.sender;
    uint public lastOwnerChange = now;

    modifier onlyBy(address _account) {
        require(msg.sender == _account);
        _;
    }

    modifier onlyAfter(uint _time) {
        require(now >= _time);
        _;
    }

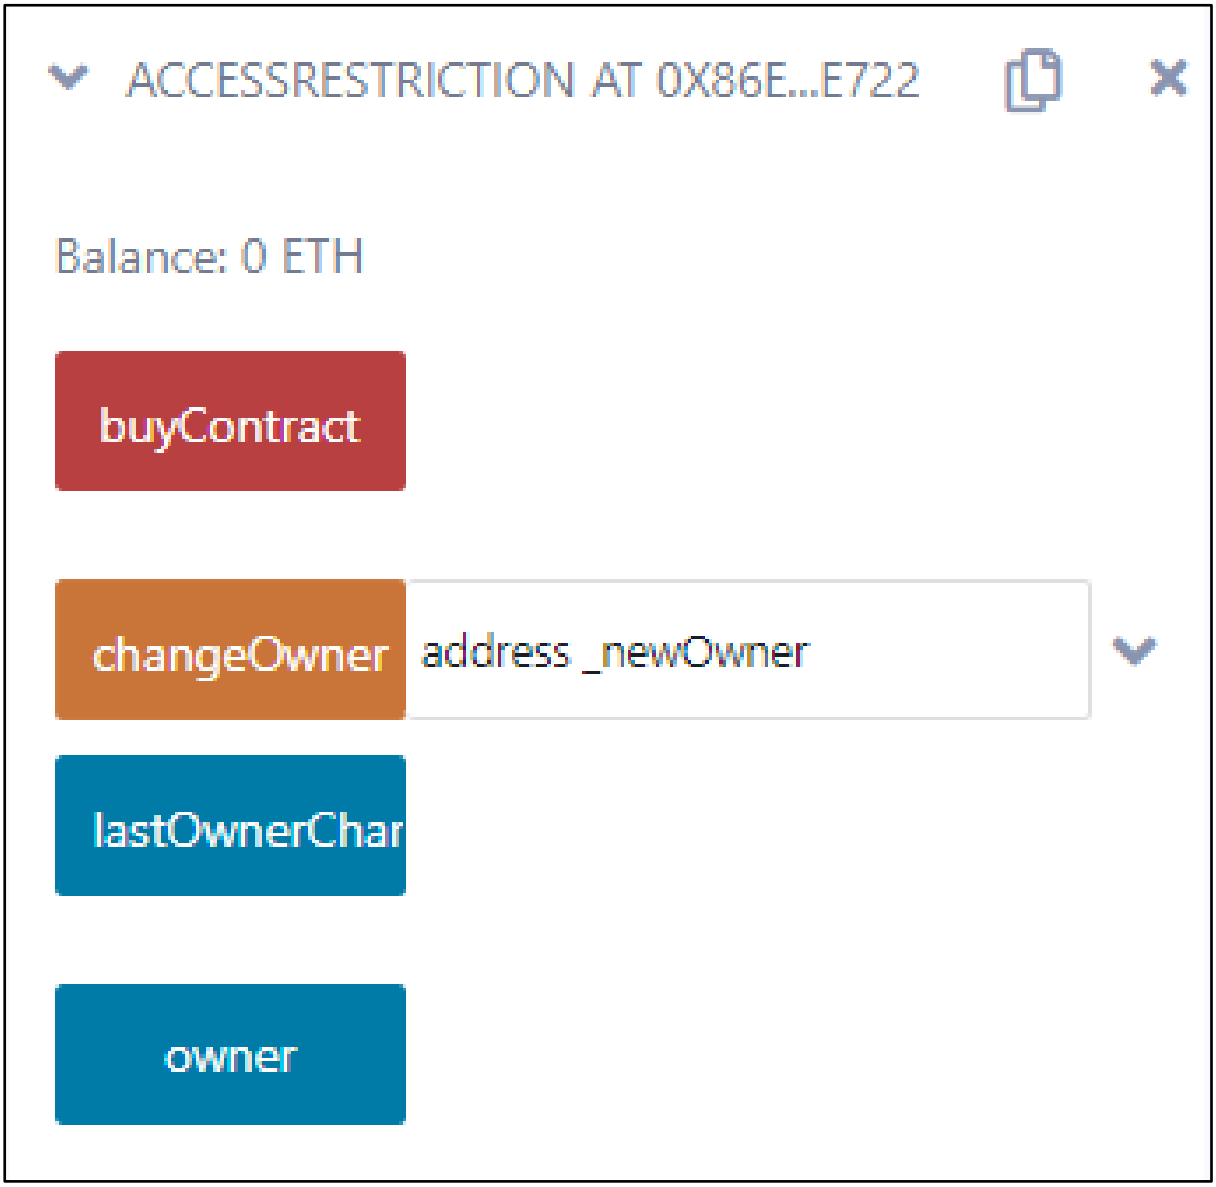
    modifier costs(uint _amount) {
        require(msg.value >= _amount);
        _;
        if (msg.value > _amount) {
            msg.sender.transfer(msg.value - _amount);
        }
    }

    function changeOwner(address _newOwner) public onlyBy(owner) {
        owner = _newOwner;
    }

    function buyContract() public payable onlyAfter(lastOwnerChange +
4 weeks) costs(1 ether) {
```

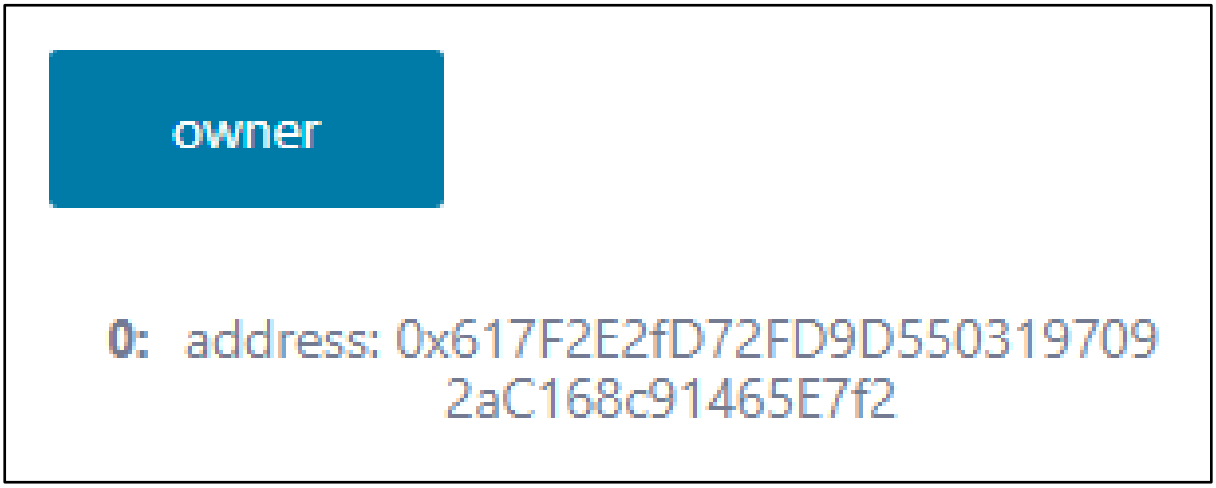
```
        owner = msg.sender;
        lastOwnerChange = now;
    }
}
```

OUTPUT:



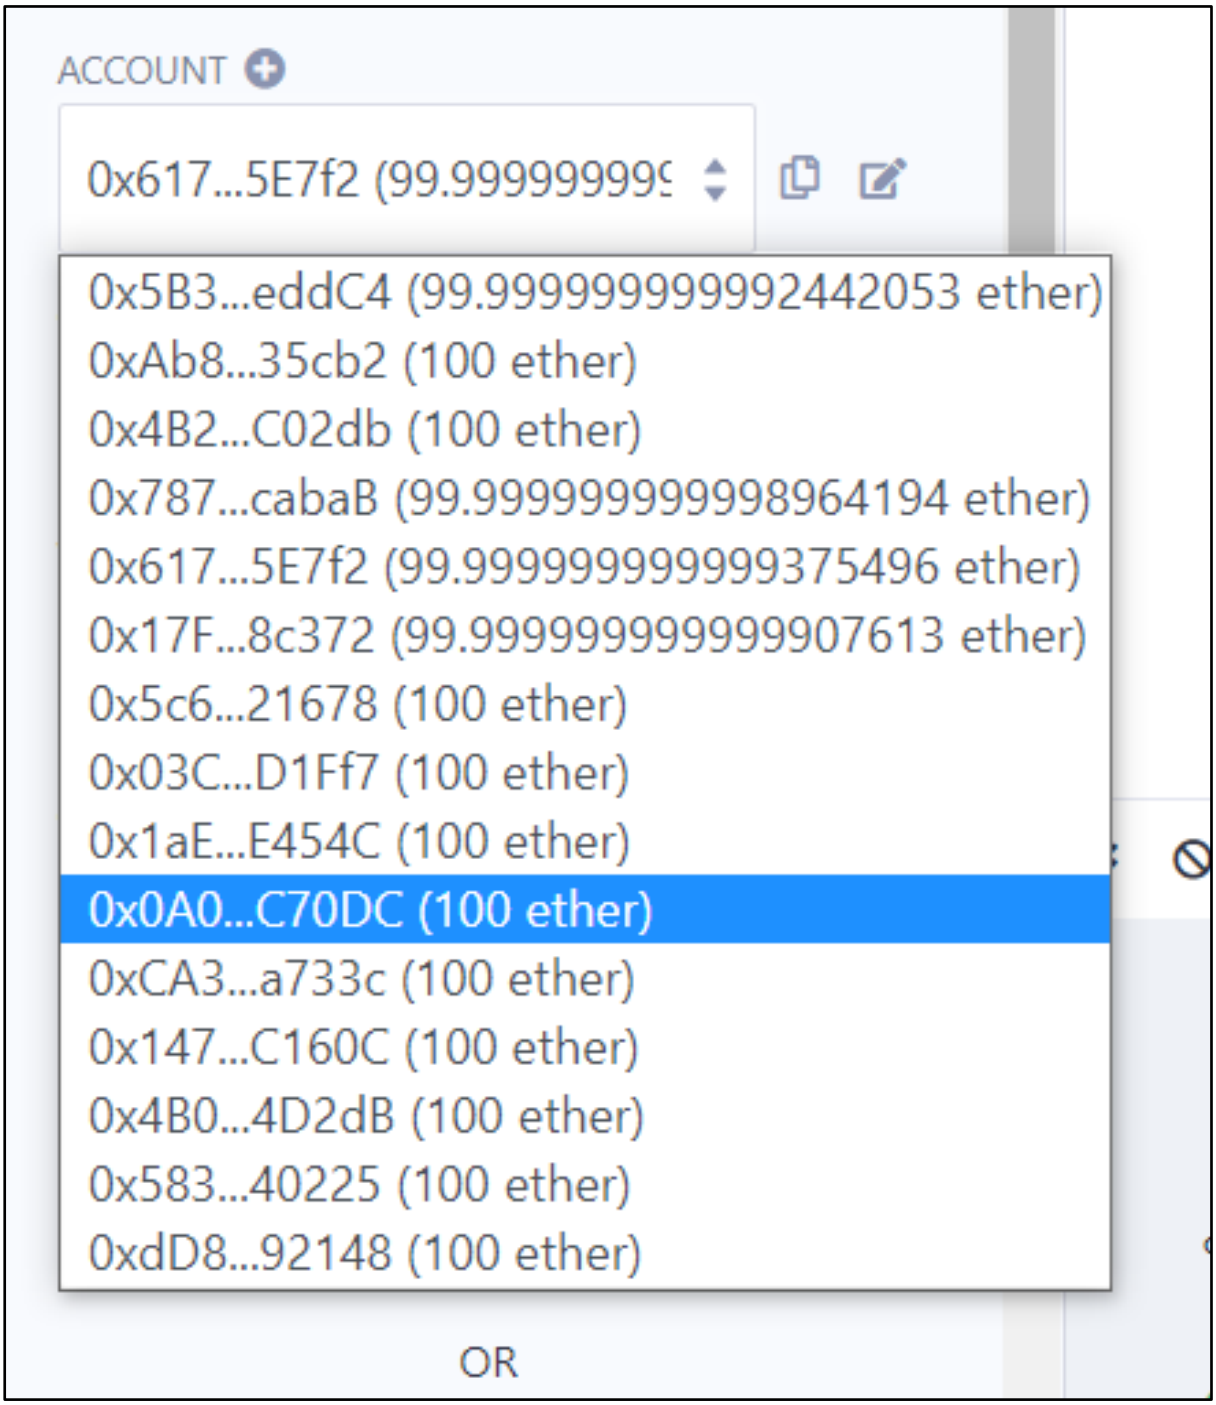
ACCESSRESTRICTION AT 0X86E...E722
Balance: 0 ETH
buyContract
changeOwner
address _newOwner
lastOwnerChar
owner

Step 1: Click on owner to create the owner object.

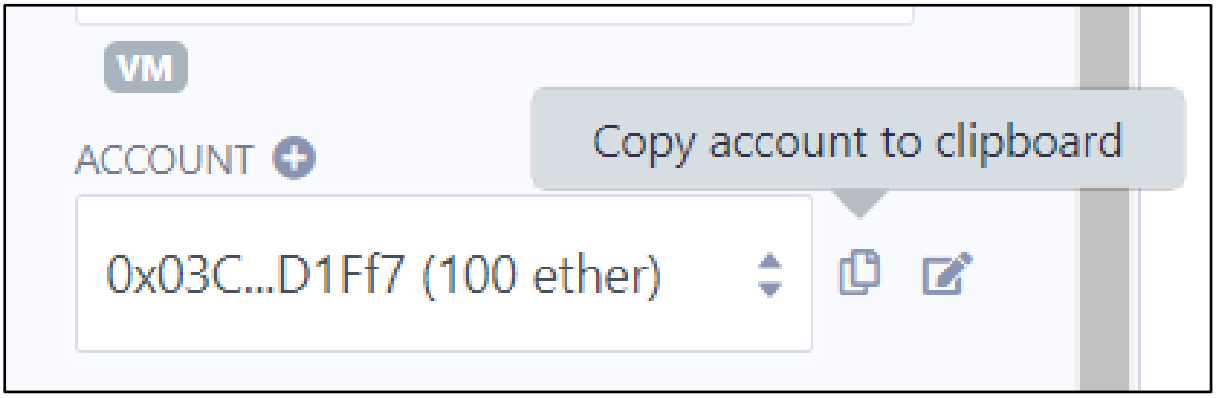


Step 2: Click on lastOwnerChange button.

Step 3: Change the address of the account from Account dropdown in Deploy tab of Remix IDE.

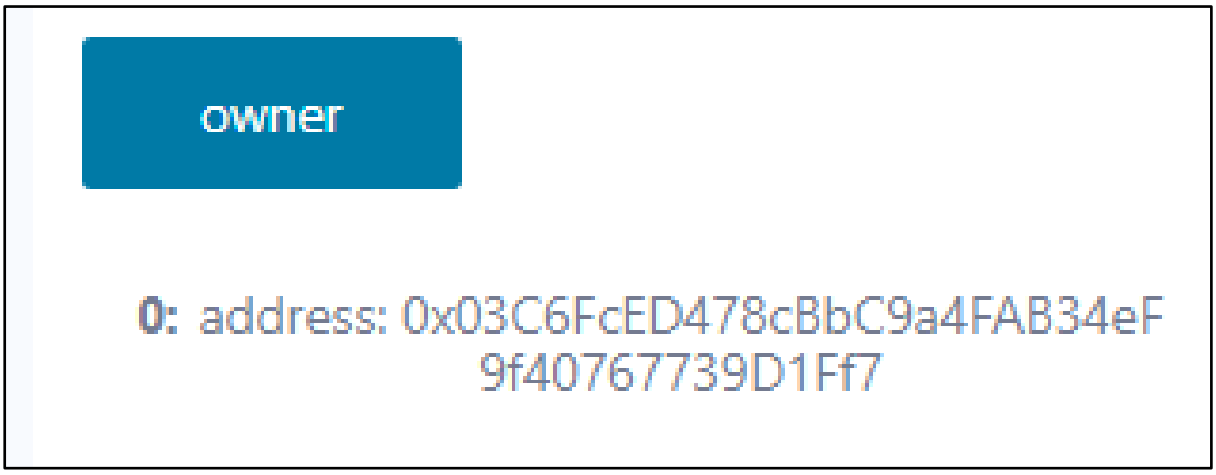


Step 4: Copy and paste the address in changeOwner input and click on changeOwner.



Step 5: You should get an error as following.

Step 6: Now, change back to the actual address of the account and click on changeOwner.



[B] Contracts, Inheritance, Constructors, Abstract Contracts, Interfaces.

[I] Contracts

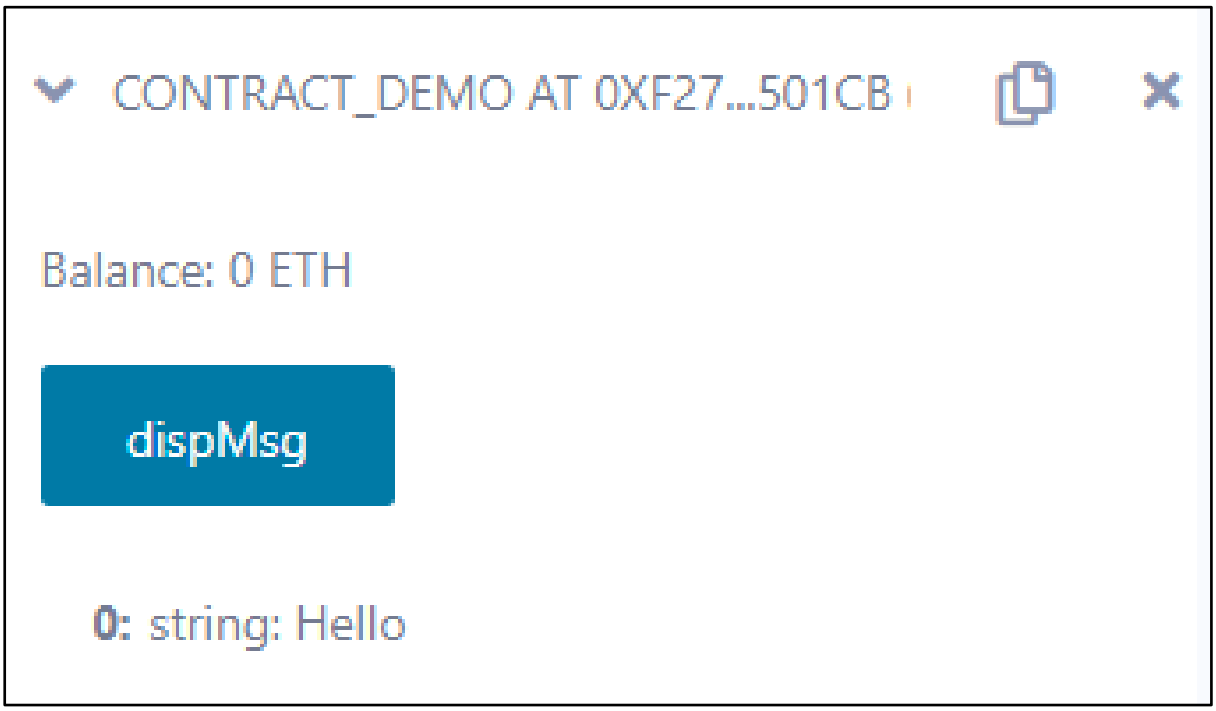
CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

contract Contract_demo {
  string message = "Hello";

  function dispMsg() public view returns (string memory) {
    return message;
  }
}
```

OUTPUT:



[II] Inheritance

CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

contract Parent {
  uint256 internal sum;

  function setValue() external {
    uint256 a = 10;
    uint256 b = 20;
    sum = a + b;
  }
}

contract child is Parent {
  function getValue() external view returns (uint256) {
    return sum;
  }
}

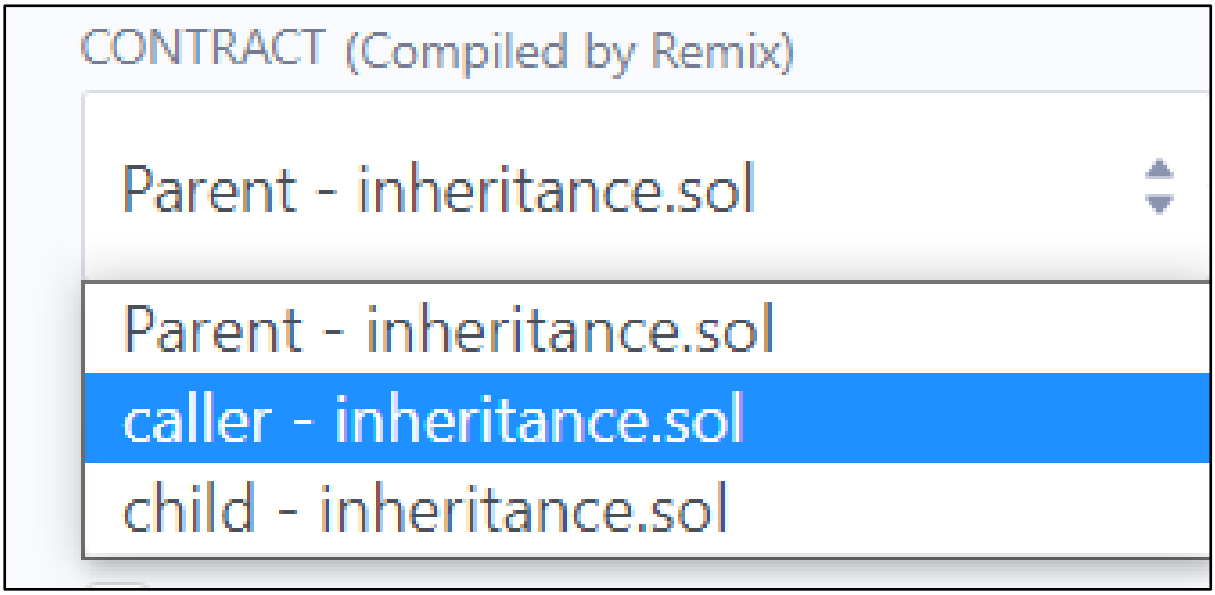
contract caller {
  child cc = new child();

  function testInheritance() public returns (uint256) {
    cc.setValue();
    return cc.getValue();
  }

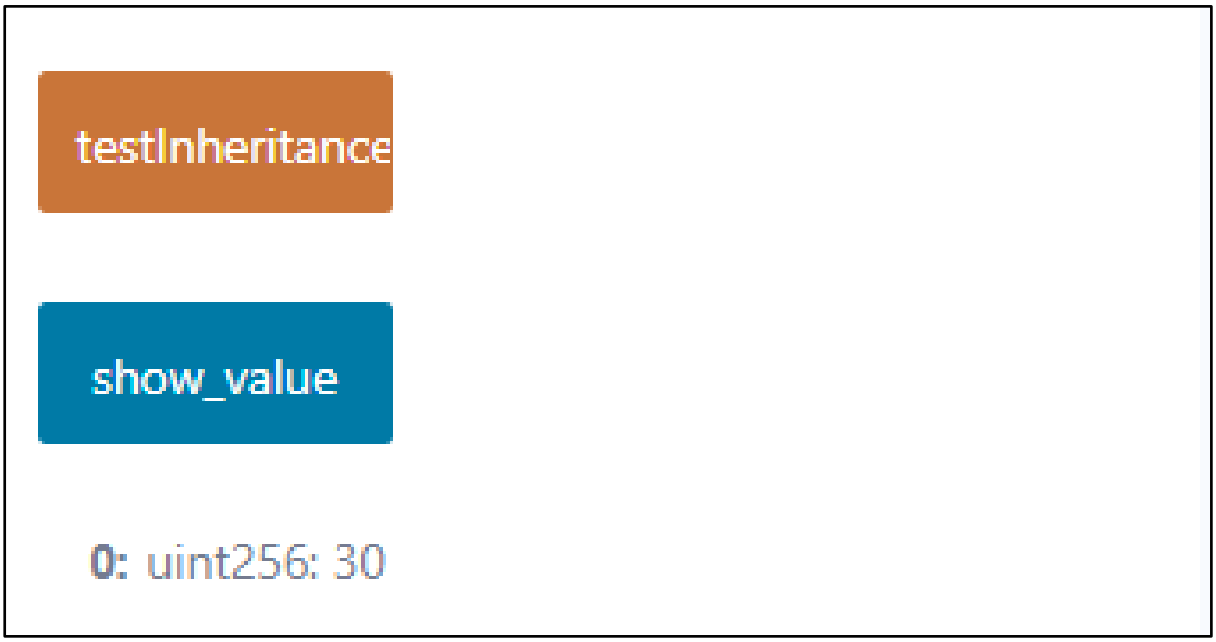
  function show_value() public view returns (uint256) {
    return cc.getValue();
  }
}
```

OUTPUT:

Step 1: Select caller contract and deploy.



Step 2: Click test Inheritance and then click on show_value to view value.



[III] Constructors

CODE:

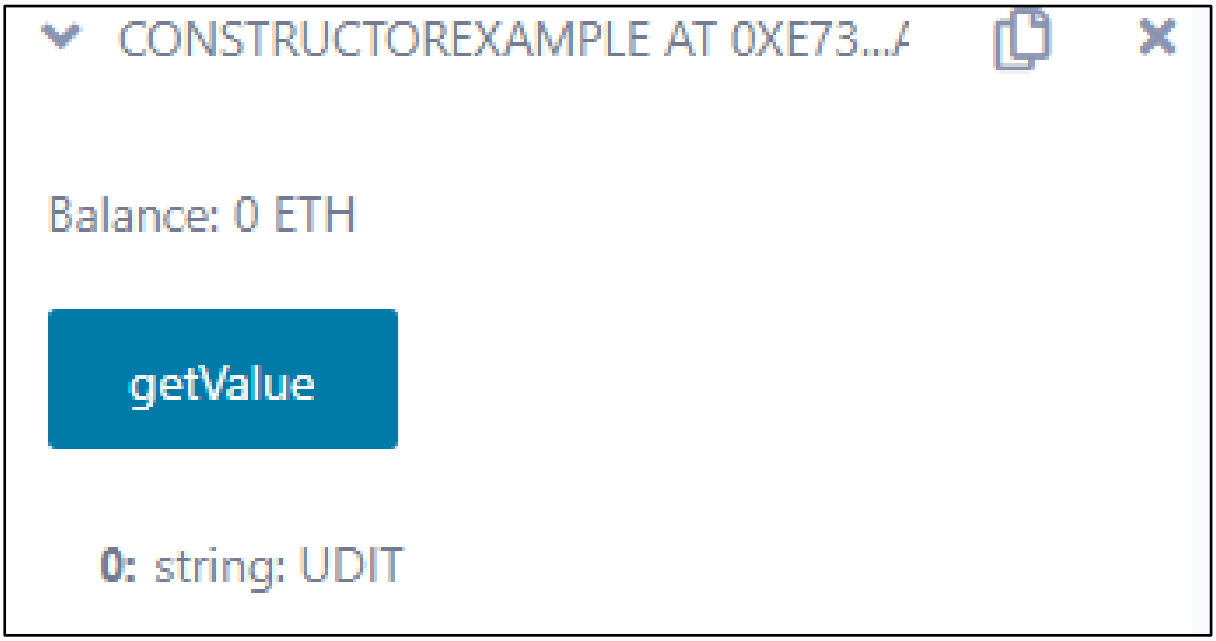
```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

// Creating a contract
contract constructorExample {
  string str;

  constructor() public {
    str = "UDIT";
  }

  function getValue() public view returns (string memory) {
    return str;
  }
}
```

OUTPUT:



[IV] Abstract Contracts

CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

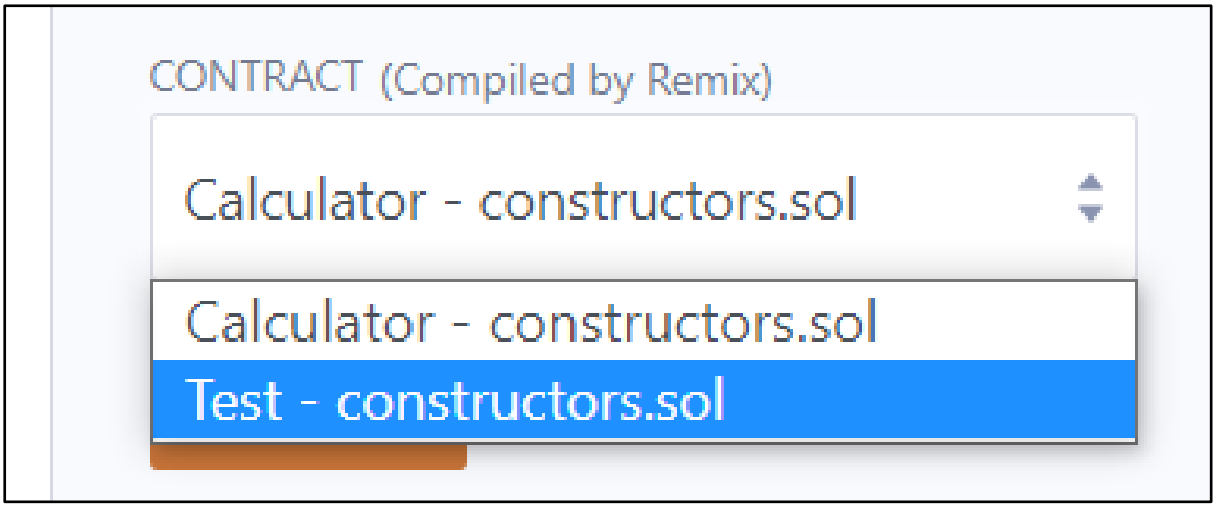
contract Calculator {
  function getResult() external view returns (uint256);
}

contract Test is Calculator {
  constructor() public {}

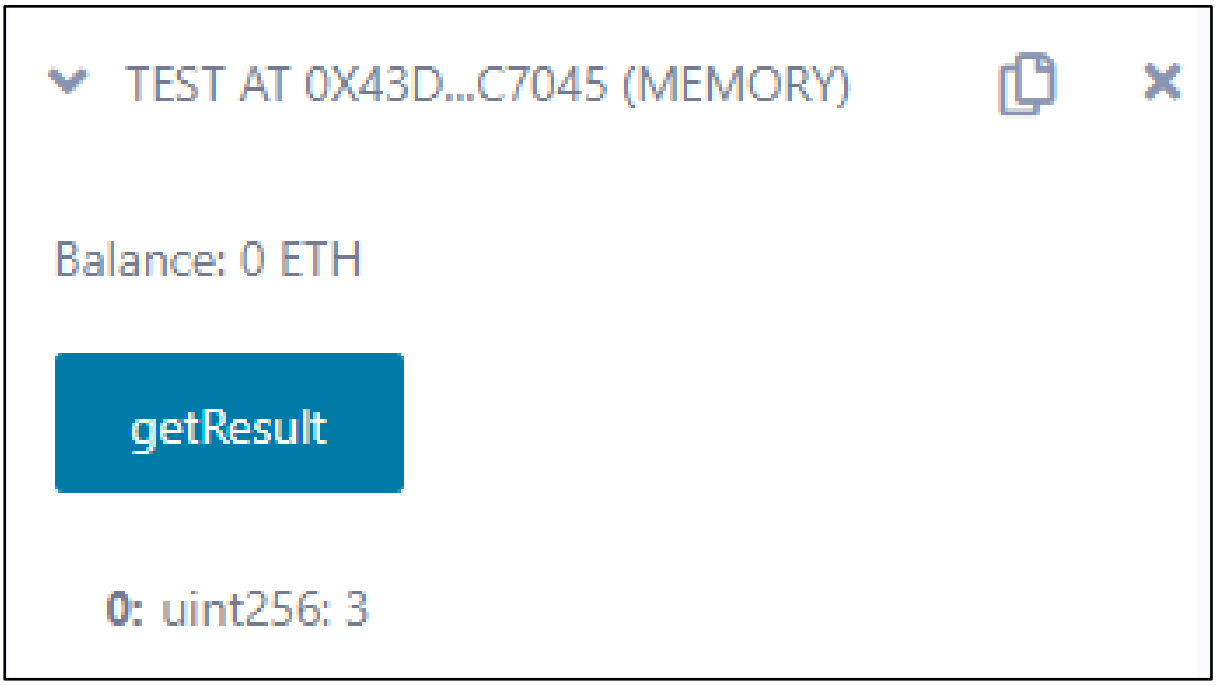
  function getResult() external view returns (uint256) {
    uint256 a = 1;
    uint256 b = 2;
    uint256 result = a + b;
    return result;
  }
}
```

OUTPUT:

Step 1: Select Test contract and deploy.



Step 2: Click on getResult to get sum of a+b.



[V] Interfaces

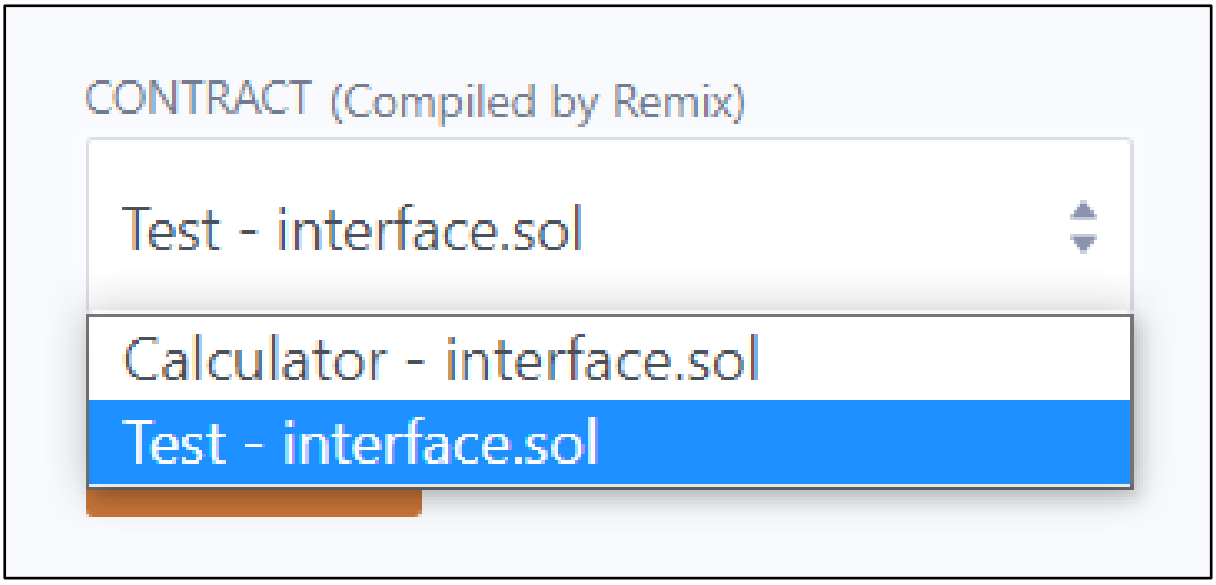
CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

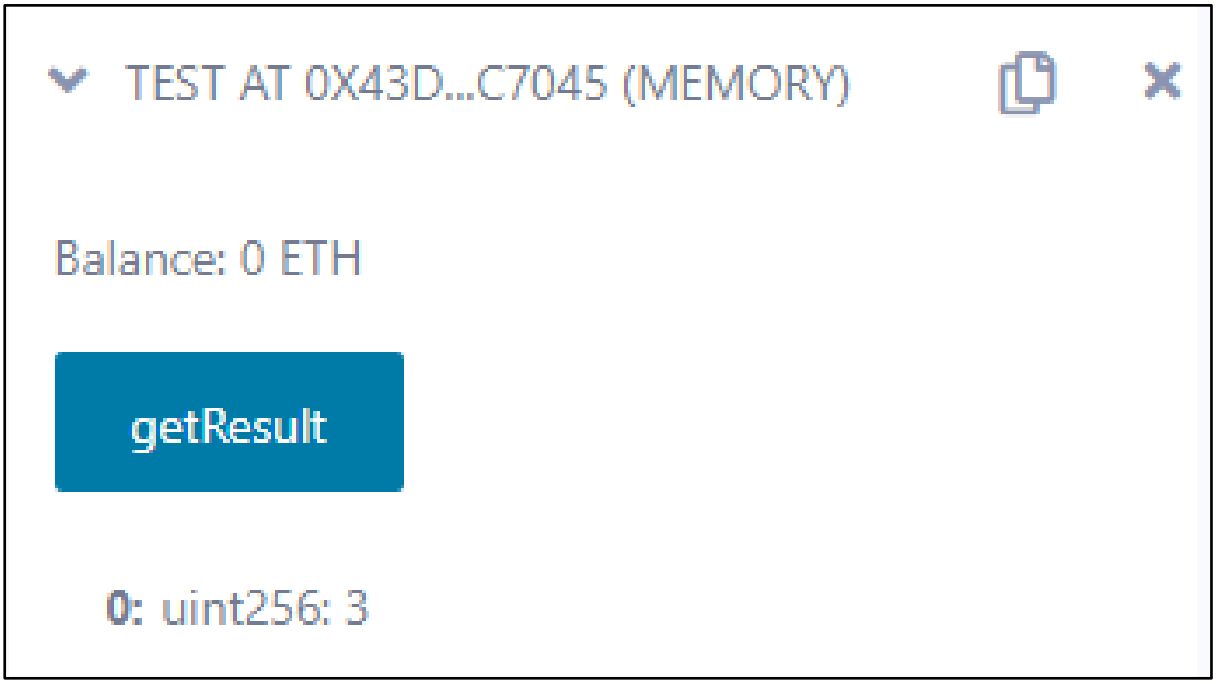
interface Calculator {
  function getResult() external view returns(uint);
}
contract Test is Calculator {
  constructor() public {}
  function getResult() external view returns(uint){
   uint a = 1;
   uint b = 2;
   uint result = a + b;
   return result;
  }
}
```

OUTPUT:

Step 1: Select Test interface contract and deploy.



Step 2: Click on getResult to get sum of a+b.



[C] Libraries, Assembly, Events, Error handling.

[I] Libraries

CODE:

Create library myLib.sol

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.0;

library myMathLib {
  function sum(uint256 a, uint256 b) public pure returns (uint256) {
    return a + b;
  }

  function exponent(uint256 a, uint256 b) public pure returns
(uint256) {
    return a**b;
  }
}
```

Using the library myLib.sol

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.0;

import "myLib.sol";

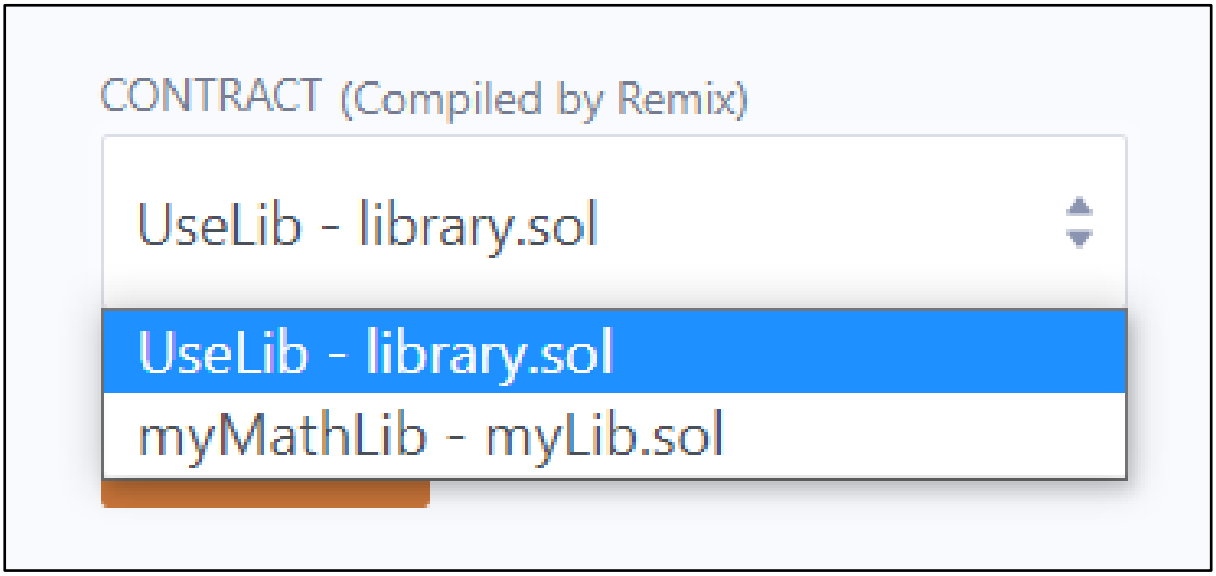
contract UseLib {
  function getsum(uint256 x, uint256 y) public pure returns (uint256)
{
    return myMathLib.sum(x, y);
  }

  function getexponent(uint256 x, uint256 y) public pure returns
(uint256) {
```

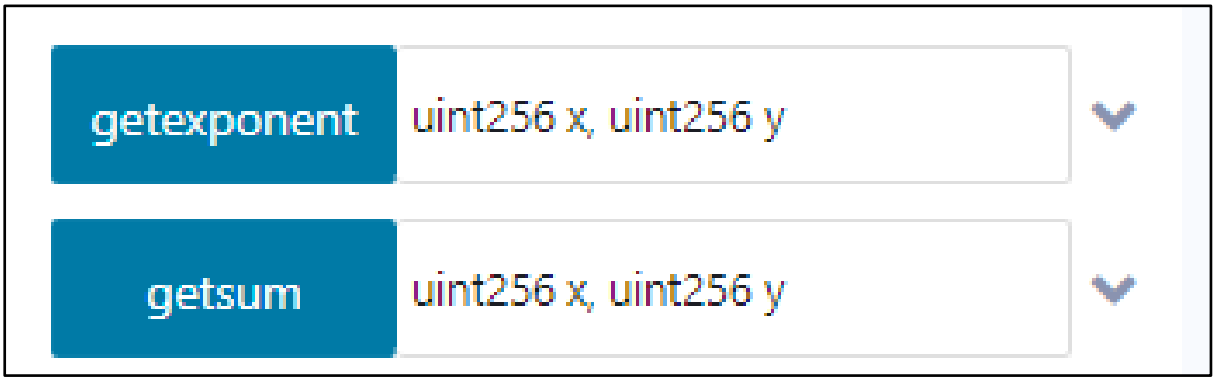
```
    return myMathLib.exponent(x, y);
  }
}
```

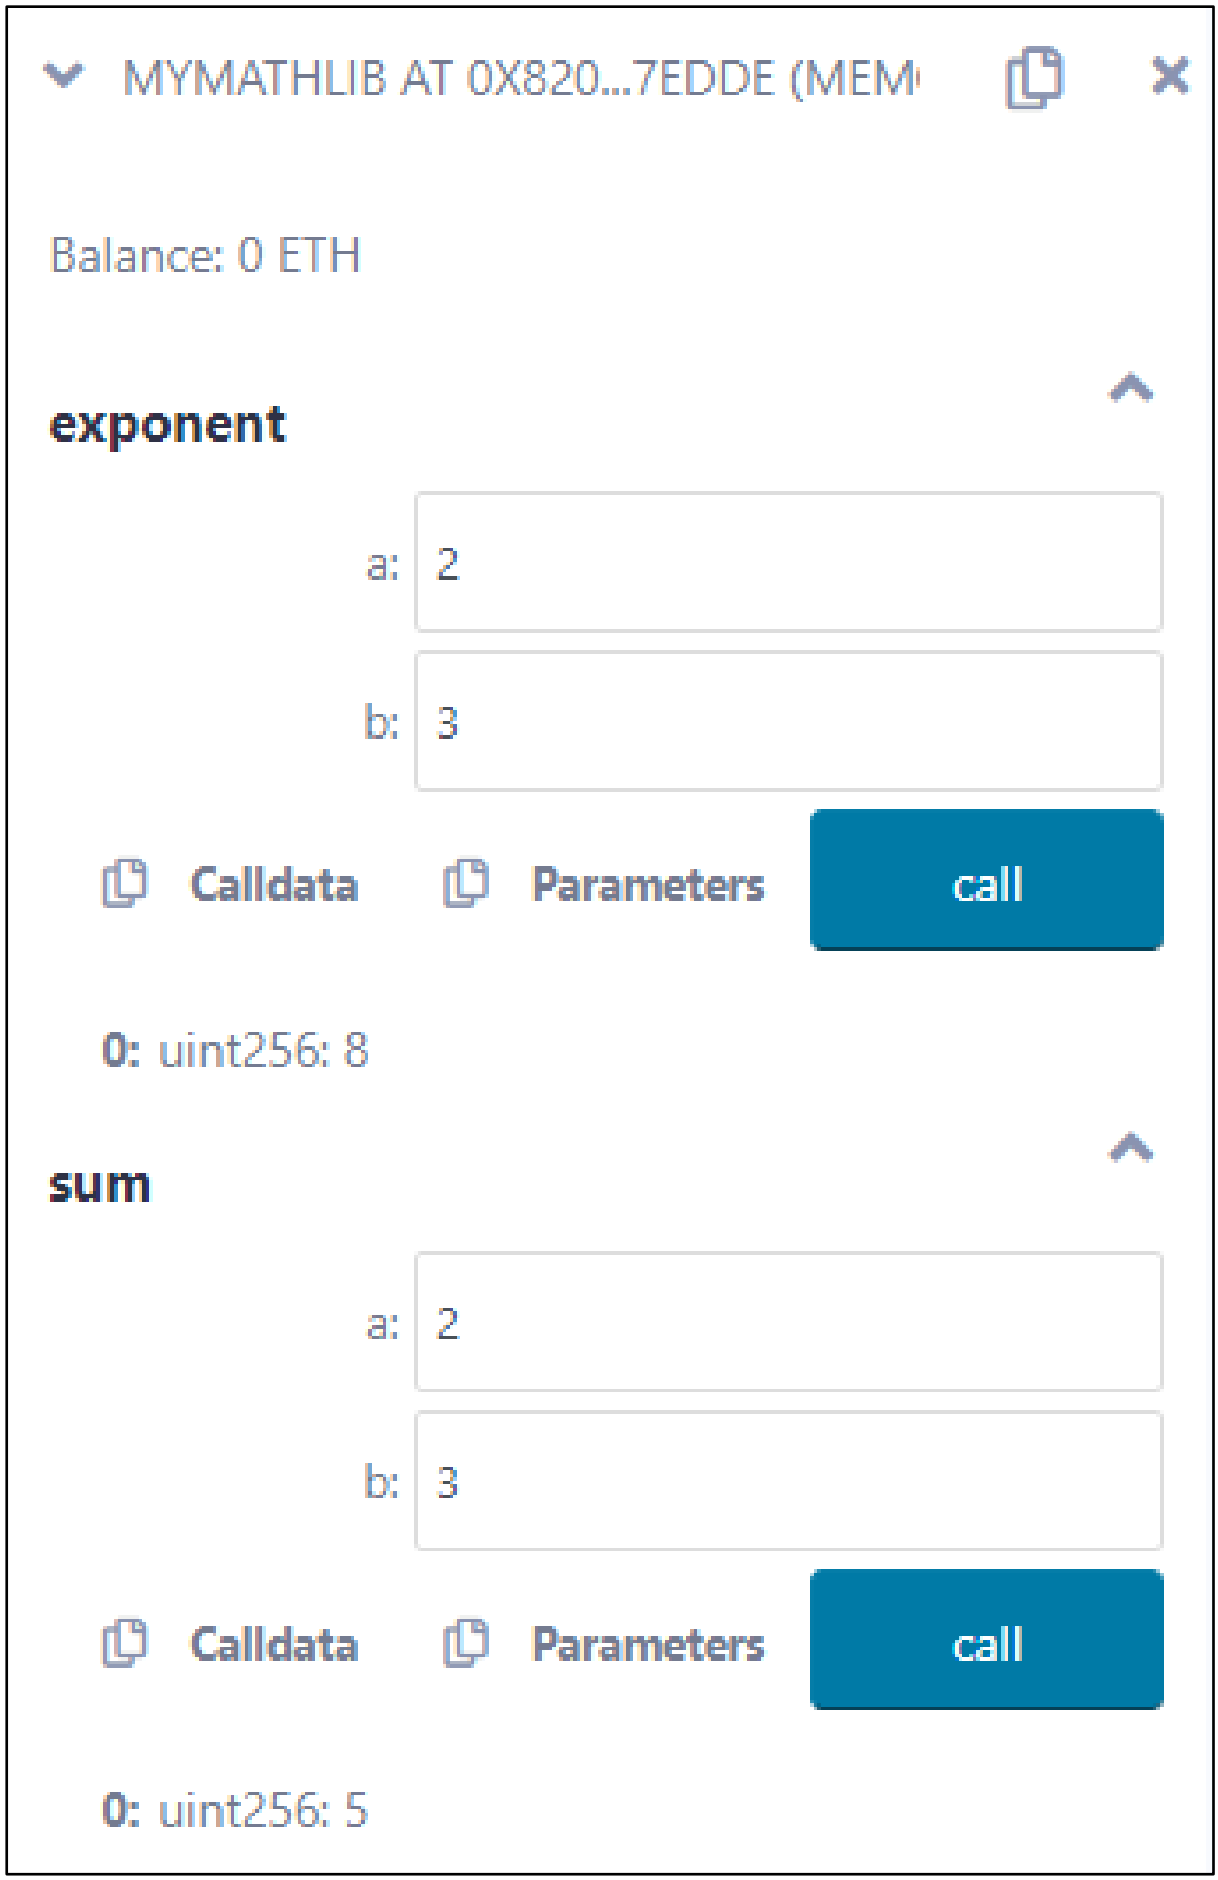
OUTPUT:

Step 1: Change contract to UseLib and deploy.



Step 2: Input values to both getexponent and getsum functions and get their values as below.





MYMATHLIB AT 0X820...7EDDE (MEM
Balance: 0 ETH

[III] Events

CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

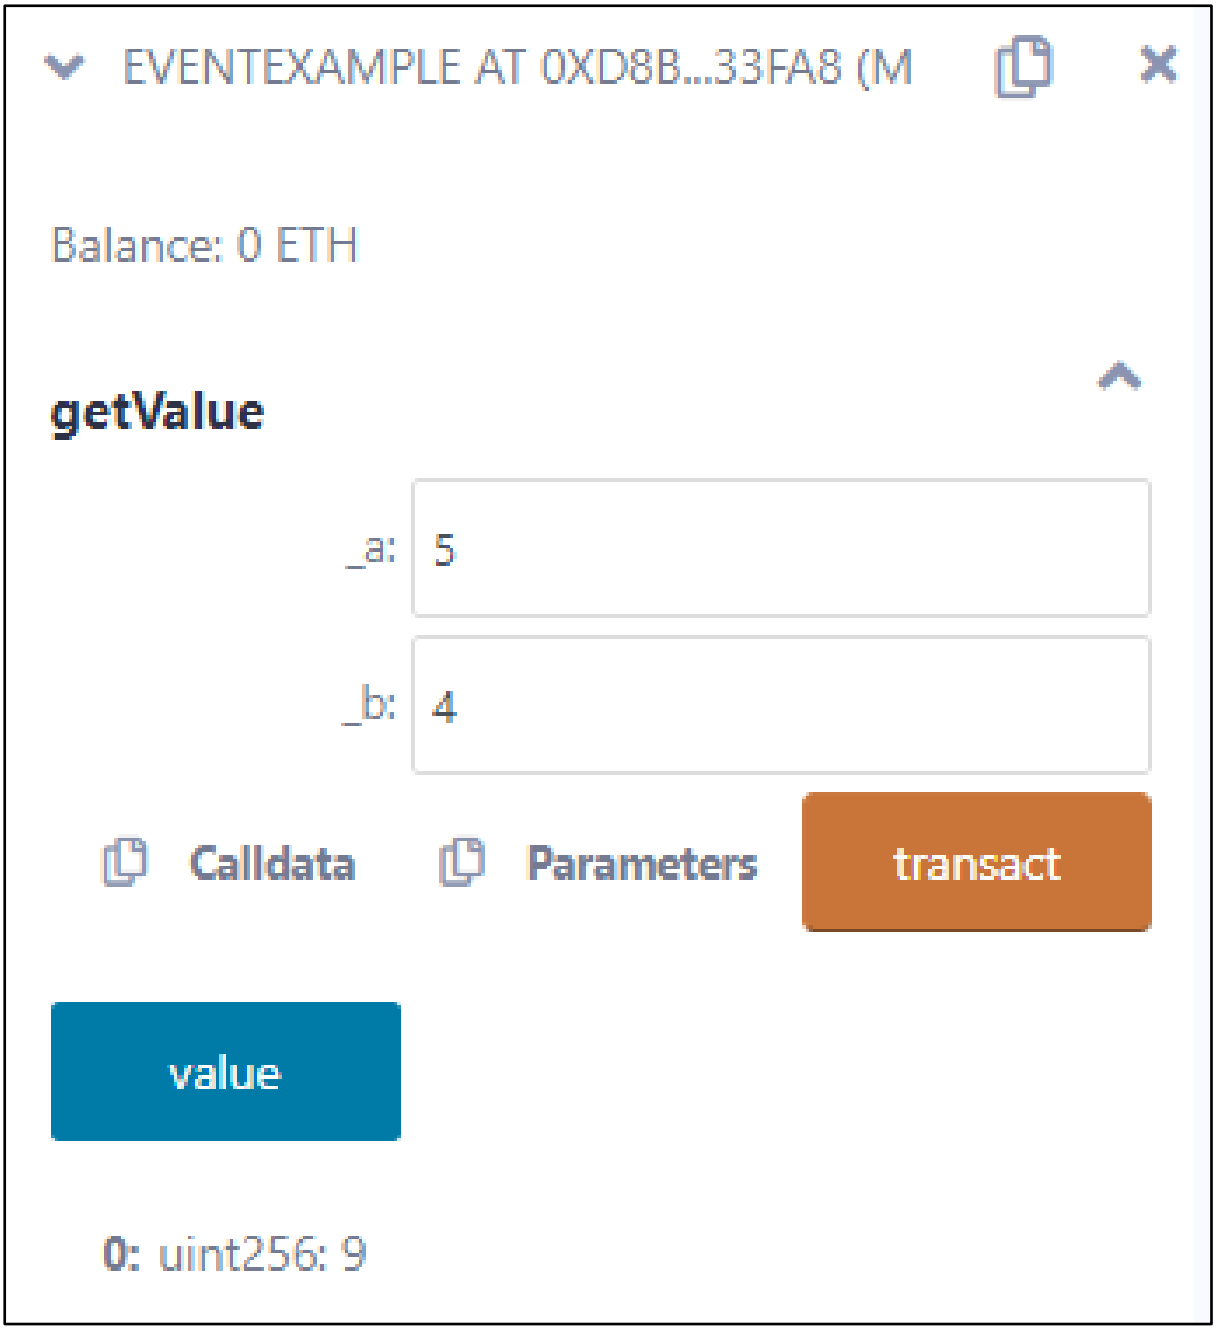
// Creating a contract
contract eventExample {
  // Declaring state variables
  uint256 public value = 0;

  // Declaring an event
  event Increment(address owner);

  // Defining a function for logging event
  function getValue(uint256 _a, uint256 _b) public {
    emit Increment(msg.sender);
    value = _a + _b;
  }
}
```

OUTPUT:

Step 1: Input values to getValue function and get the result by clicking on the value button.



Step 2: In the terminal, check for logs.

[IV] Error handling

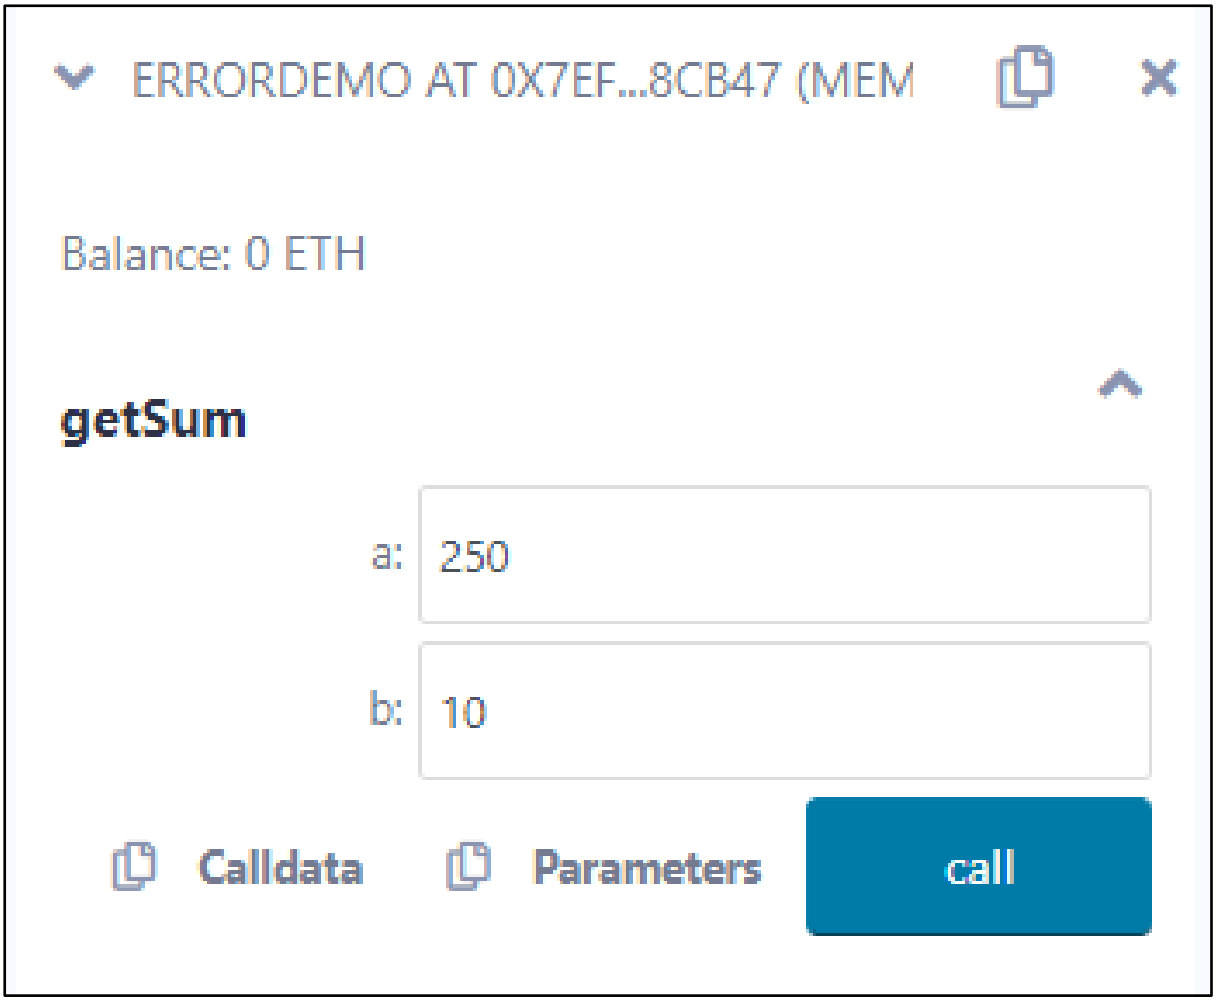
CODE:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

contract ErrorDemo {
  function getSum(uint256 a, uint256 b) public pure returns (uint256)
{
    uint256 sum = a + b;
    require(sum < 255, "Invalid");
    assert(sum<255);
    return sum;
  }
}
```

OUTPUT:

Step 1: Input values to the getSum function.



Step 2: Check terminal panel.

PRACTICAL 5

PRACTICAL 6

AIM: Write a program to demonstrate mining of Ether.

CODE:

```
from hashlib import sha256
import time

MAX_NONCE = 100000000000

def hashGenerator(text):
    return sha256(text.encode("ascii")).hexdigest()

def mine(block_number, transactions, previous_hash, prefix_zeros):
    prefix_str = '0'*prefix_zeros
    for nonce in range(MAX_NONCE):
        text = str(block_number) + transactions + previous_hash +
str(nonce)
        new_hash = hashGenerator(text)
        if new_hash.startswith(prefix_str):
            print(f"Successfully mined Ethers with nonce value :
{nonce}")
            return new_hash

    raise BaseException(f"Couldn't find correct hash after trying
{MAX_NONCE} times")

if __name__ == '__main__':
    transactions = '''
    Prateek->Hajra->77,
    Kunal->Soham->18
    '''
    difficulty = 4
    start = time.time()
```

```
    print("Ether mining started.")
    new_hash                                                    =
mine(5,transactions,'0000000xa036944e29568d0cff17edbe038f81208fecf9a
66be9a2b8321c6ec7', difficulty)
    total_time = str((time.time() - start))
    print(f"Ether mining finished.")
    print(f"Ether Mining took : {total_time} seconds")
    print(f"Calculated Hash = {new_hash}")
```

OUTPUT:

```
Ether mining started.
Successfully mined Ethers with nonce value : 35167
Ether mining finished.
Ether Mining took : 0.06797456741333008 seconds
Calculated Hash =
 0000fc864cda3e3c5ff5be050d0d74068e1367c510e162bb27af608d0d1edbea
```

PRACTICAL 7

AIM: Demonstrate the running of the blockchain node.

CODE:

```
from hashlib import sha256

def hashGenerator(text):
    return sha256(text.encode("ascii")).hexdigest()

class Block:
    def __init__(self, data, hash, prev_hash):

PRACTICAL 9

AIM: Create your own blockchain and demonstrate its use.

CODE:

```
from hashlib import sha256

def hashGenerator(text):
    return sha256(text.encode("ascii")).hexdigest()

class Block:
    def __init__(self,data,hash,prev_hash):
        self.data=data
        self.hash=hash
        self.prev_hash=prev_hash

class Blockchain:
    def __init__(self):
      hashLast=hashGenerator('gen_last')
      hashStart=hashGenerator('gen_hash')

      genesis=Block('gen-data',hashStart,hashLast)
      self.chain=[genesis]

    def add_block(self,data):
        prev_hash=self.chain[-1].hash
        hash=hashGenerator(data+prev_hash)
        block=Block(data,hash,prev_hash)
        self.chain.append(block)

bc=Blockchain()
bc.add_block('1')
bc.add_block('2')
bc.add_block('3')
```

```
for block in bc.chain:
    print(block.__dict__)
```

OUTPUT:

```
{'data': 'gen-data', 'hash':
